

Kuo-Sheng Neutrino Experiment :

Status and First Results

- **TEXONO Collaboration : Overview**
- **Kuo-Sheng Neutrino Laboratory**
- **First Results with ULB-HPGe**
- **Status and Plans**

Henry T. Wong
Academia Sinica, Taiwan
WIN02, Jan 02

Q. Yue[¶], D.X. Zhao, J.W. Zhao, P.P. Zhao, S.Q. Zhao, B.A. Zhuang
Institute of High Energy Physics, Beijing, China

Z.S. Liu, Z.Y. Zhang
Institute for Radiation Protection, Taiyuan, China

T.Y. Chen
Nanjing University, Nanjing, China

J.P. Cheng
Tsing Hua University, Beijing, China

C.Y. Chang, G.C.C. Chang[†]
University of Maryland, Maryland, U.S.A.

[†] Co-Principal Investigators

[‡] Project Leaders

[¶] Ph.D. Students

HISTORY

Initiate: **Chang Chung-Yun, 1996**

First Collaboration Meeting/Official Start: **October 1997**

First Paper Submitted: **October 1998**

KS Reactor Experiment Installation: **June 2000**

First Ph.D.: **Liu Yan, July 2000**

First Data Taking: **January 2001**

First Physics Data Taking: **June 2001**

[†] **Taiwan EXperiment On Neutrino.**

Home Page @ <http://hepmail.phys.sinica.edu.tw/textono/index.html/>

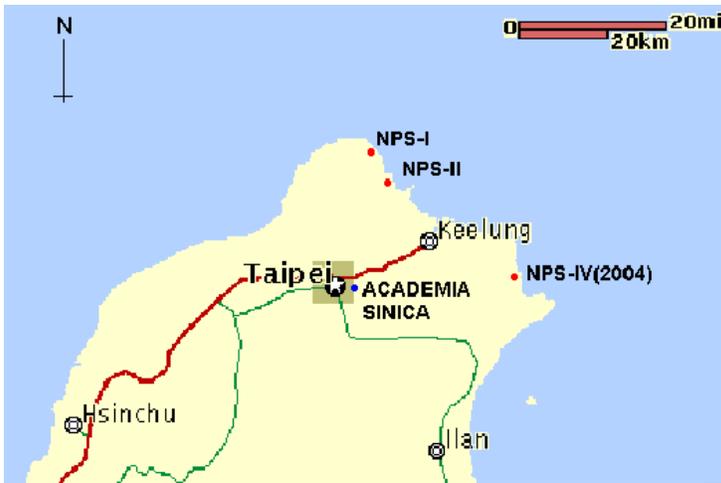

KS Experiment:

- **Elaborate Electronics & Shieldings**
- **Flexible Detector Possibilities**
- **Full Recording of Pulse Shape+Timing Info**
- **Study Neutrino Properties & Interactions**

R&D Projects:

- **CsI(Tl) for Dark Matter**
- **Low Energy Neutrino Detection:
loaded Gd/Yb crystals, ULE –HPGe**
- **AMS for Radiopurity Measurements**
- **Upgrade FADCs for LEPS/SPring-8
+FPGA on-board processing**

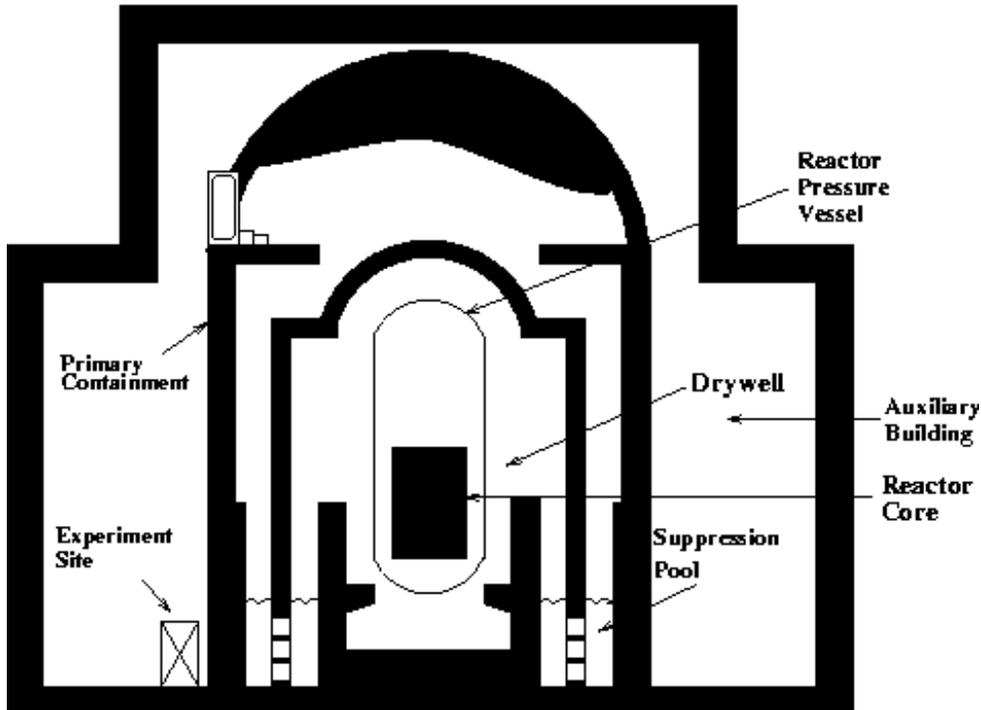

Kuo-Sheng Nuclear Power Plant

KS NPS-II :
2 cores X 2.9 GW

Kuo-sheng Nuclear Power Station : Reactor Building

KS v Lab:
28 m from
core#1

Kuo Sheng Reactor Neutrino Laboratory

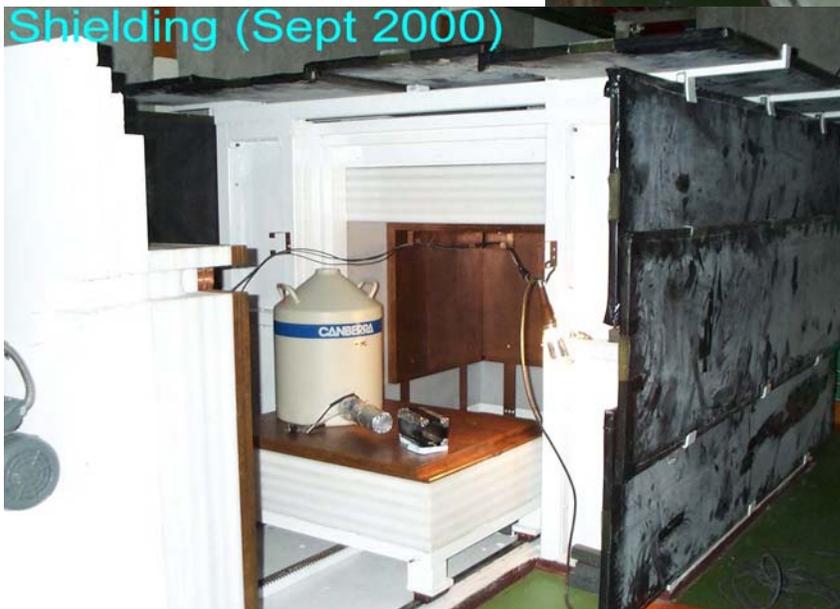

Front Gate

**(cosmic vetos,
shieldings,
control room**

Shielding (Sept 2000)

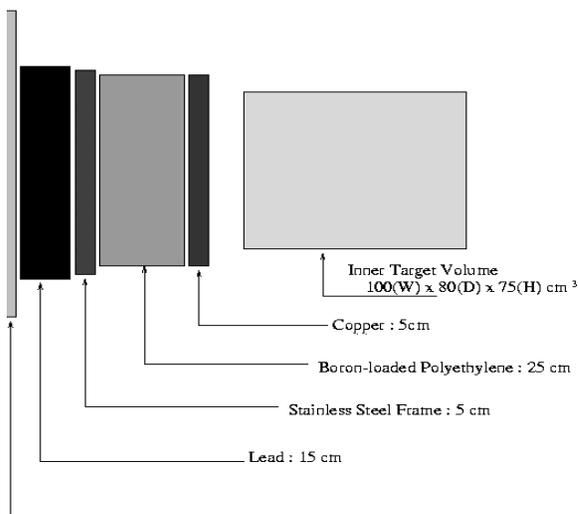

**Inner Target
Volume**

KS Expt. : Period I Configuration

Period I : June 01 – March 02 (60 days OFF)

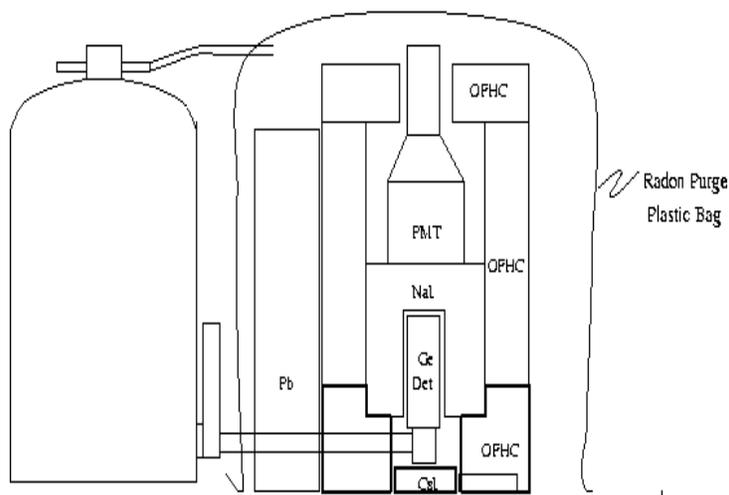

Shielding Design
[Only One out of Six Sides Shown]

Shielding & Veto

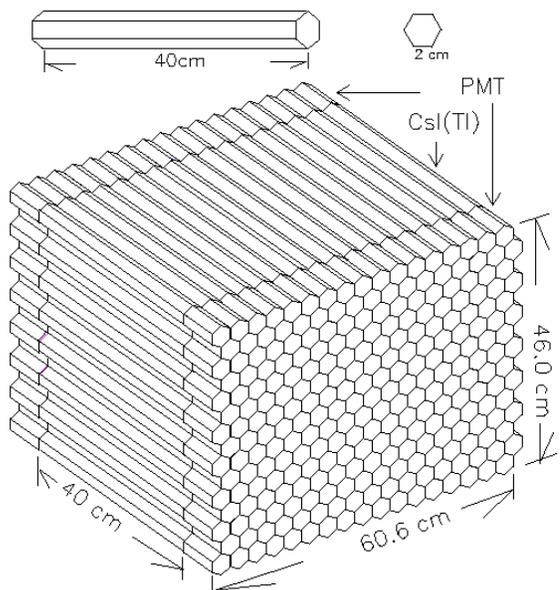

[one side]

Kuo-Sheng Experiment : HPGc Detector

ULB-HPGe + Anti-Comptons

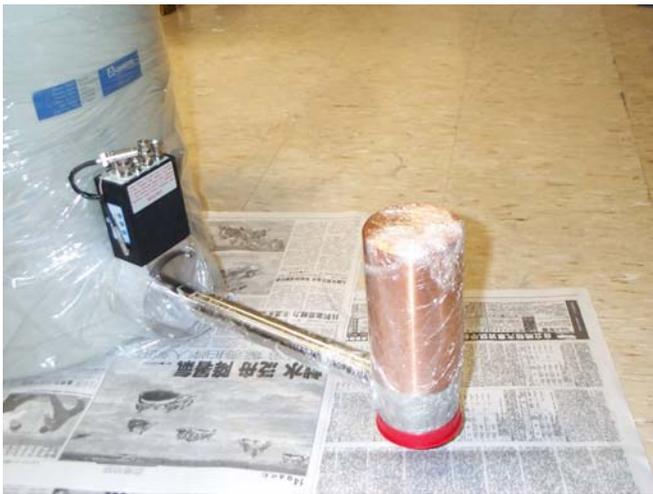

CsI(Tl) Longitudinal View Cross-Sectional View

CsI(Tl) Array

KS Expt: Period I Detectors

ULB-HPGe [1 kg]

CsI(Tl) [46 kg]

Flash ADC Module

FADC Readout
[16 ch., 20 MHz,
8 bit]

Multi-Disks
Array
[600 Gb]

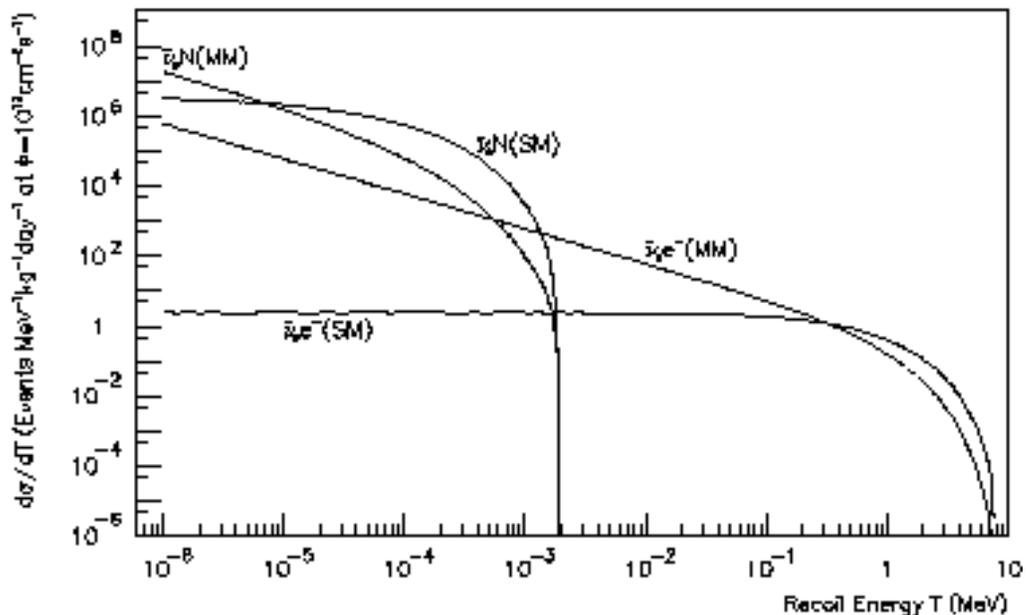

μ_ν with Reactor $\bar{\nu}_e$

⊙ μ_ν :

- parametrize possible $\nu_i^L \rightarrow \nu_j^R + \gamma$ vertices
- Both $i=j$ “diagonal”
& $i \neq j$ “transition” moments

⊙ Experimental Probe:

- Study $\bar{\nu}_e + e^- \rightarrow \nu_X + e^-$
- Focus on Low Recoil Energy
 - $\sigma_{\mu\nu} \propto T^{-1}$
 - decouple SM “background”
(LE Reactor $\phi(\bar{\nu}_e)$ not accurate)

- Look for Excess in Reactor ON/OFF

⊙ Neutrino Radiative Decay (Γ_ν):

- $\sigma_{\mu\nu}$ & Γ_ν related
- Same vertices, Real γ for Γ_ν

KS/P1/Ge/ $\mu\nu$ Data

⊙ Data Volume:

- ↪ Expected total 170/60 days ON/OFF
- ↪ Reported here : 62/46 days ON/OFF

⊙ HPGe Performance:

- ↪ 1.06 kg mass
- ↪ 0.4 keV RMS at 10 keV
- ↪ Threshold 5 keV [Unique data]

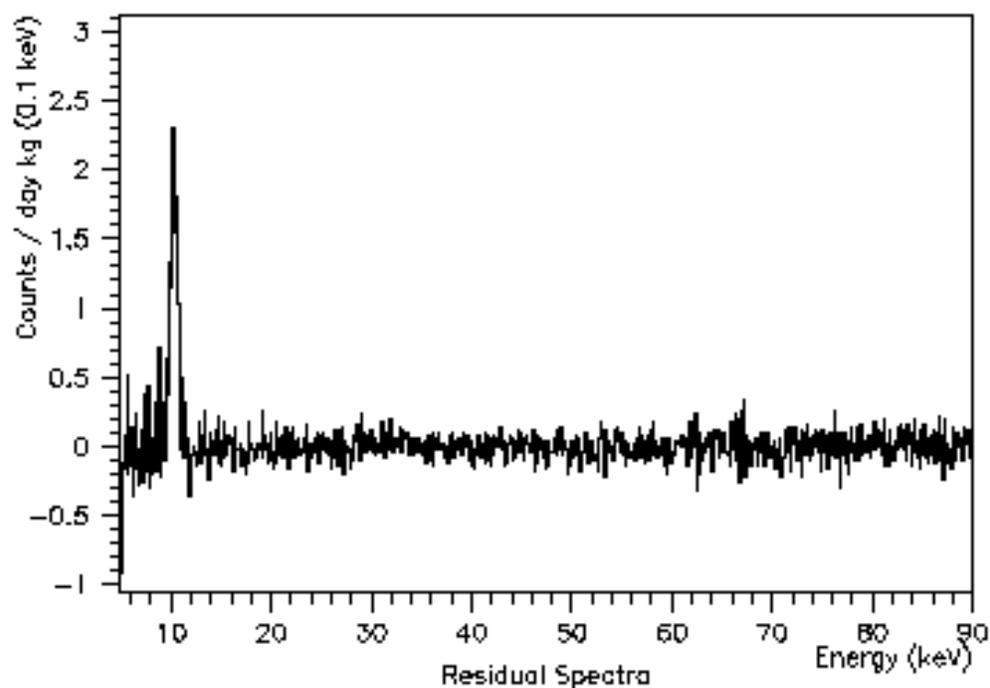

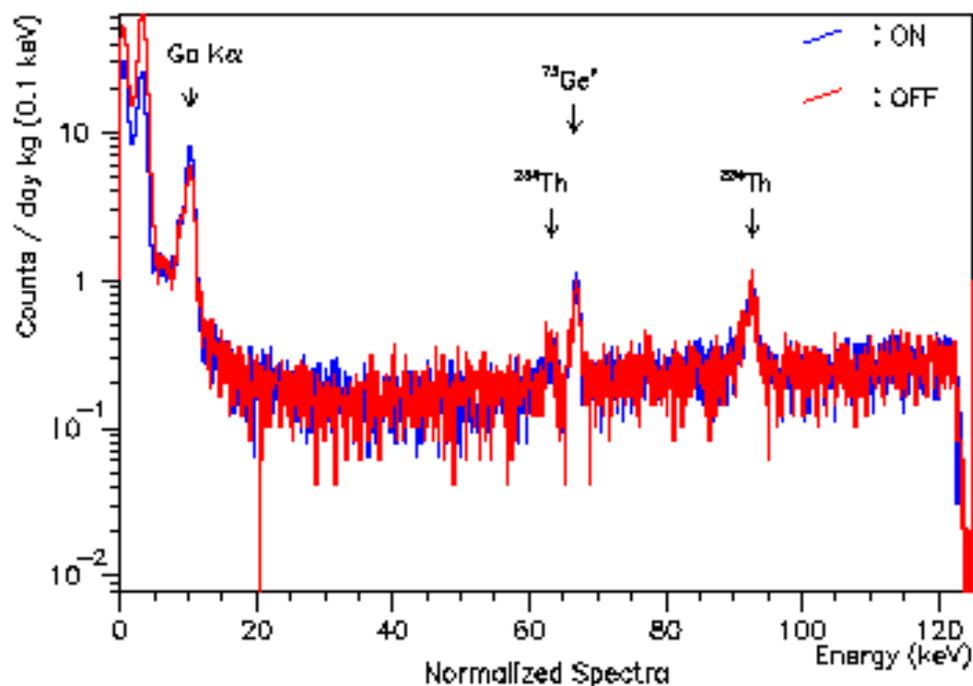

⊙ Analysis:

- ↪ Cosmic Veto (5 μ s)
- ↪ Anti-Compton (Well+Base detectors)
- ↪ Pulse Shape Disc. (veto elect. noise)
- ↪ Timing Analysis (veto clusters)
- ↪ (not yet implemented here)

⊙ Efficiencies Normalization:

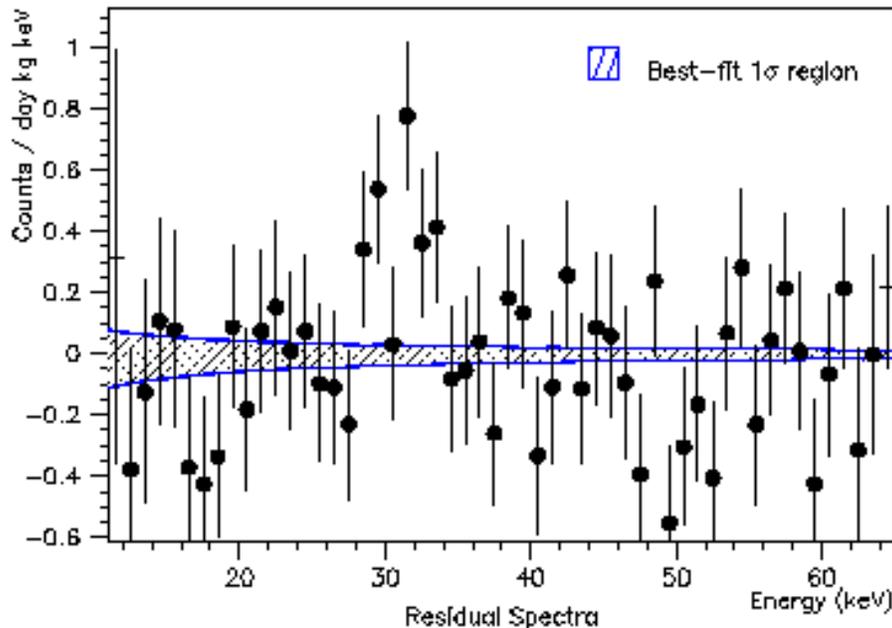

- ↪ DAQ book-keeping
- ↪ Monitor random triggers
- ↪ Monitor residual ^{40}K peaks
- ↪ Monitor 10 keV Ga X-rays peak

KS/P1/Ge : Latest Analysis

Based on 62/46 days of ON/OFF Data

KS/P1/Ge : First Results

- ⊙ Fit Residual Data > 12 keV to

$$\phi_{SM} + \mu_\nu^2 \phi_{MM} [10^{-10} \mu_B]$$

- ⊙ Best Fit (@ $\chi^2/\text{dof} = 79/78$) :

$$\mu_\nu^2 = -0.76 \pm 3.41$$

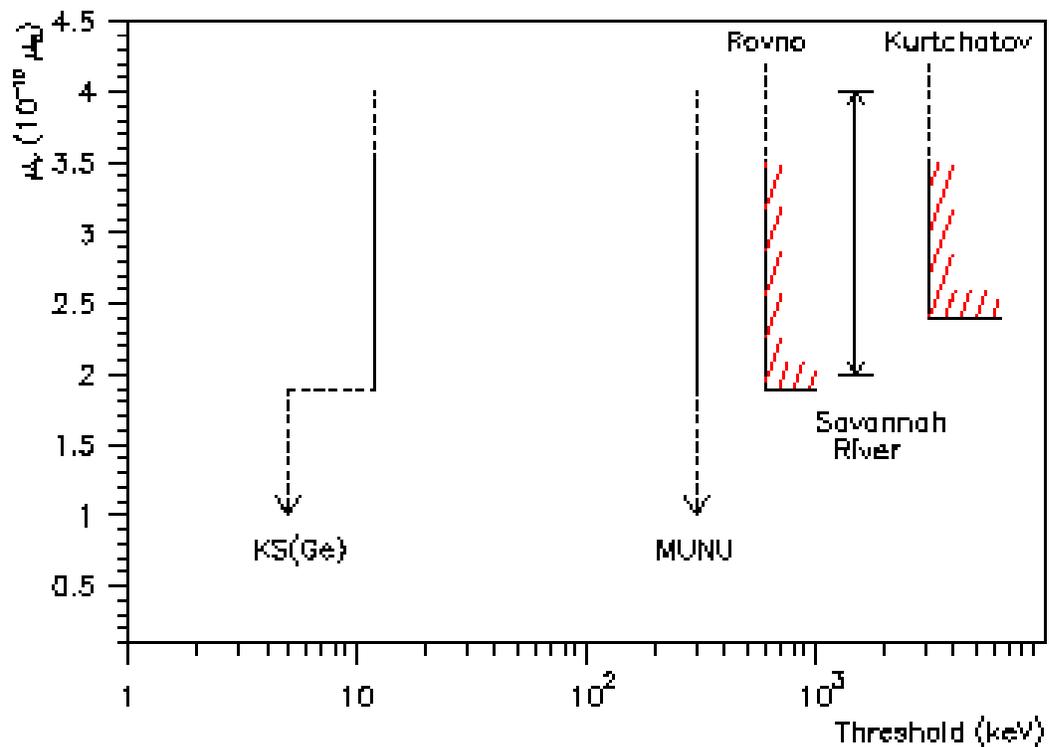

↪ (comparable sensitivities to direct search world-limits)

- ⊙ Improvement expected from:

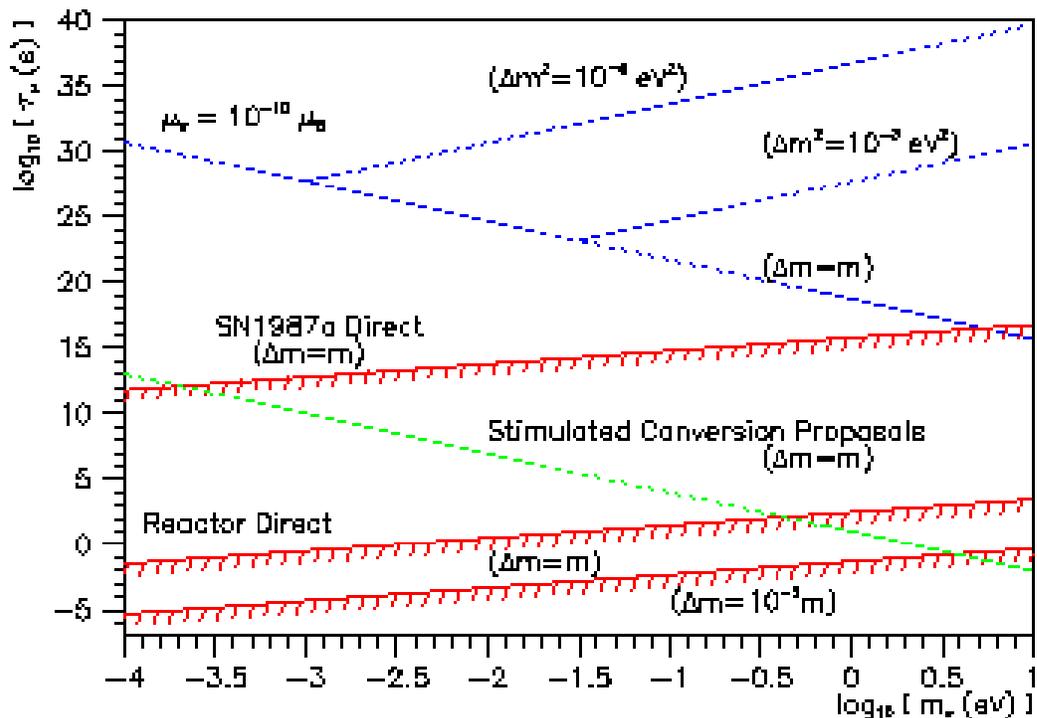

- ↪ more data
- ↪ complete and improved analysis
- ↪ treatment of threshold region

- ⊙ More data taking with upgraded hardware in P2 (2nd half 2002)

Reactor $\mu_\nu(\bar{\nu}_e)$ Sensitivities

Γ_ν Sensitivities

KS Expt : P1 Analysis

ULE-HPGe : UNIQUE Low Threshold Data

⊙ Established Problem :

μ_ν & Γ_ν for $\bar{\nu}_e$ from

⊙ + Speculative Analysis :

* Study ν_e Flux from Reactor

→ From neutron excitation producing

e.g. ^{51}Cr , ^{55}Fe

→ μ_ν and Γ_ν for ν_e (distinct energy and timing)

* Anomalous Neutrino Interactions in Matter

→ Anomalous energy deposition X ($>eV$)

(similar analysis as accelerator ν_μ)

* Study Possible Nuclear Transitions

→ e.g. $^{73}\text{Ge}^0$ decays by 2γ 's (53.4 keV, 13.3 keV)

separated by $\tau_{\frac{1}{2}} = 4.6 \mu\text{s}$

CsI(Tl) detector : Technical Run

⊙ Event Reconstruction

⊙ Background Studies

⊙ Optimize for P2, e.g., $\sigma(\bar{\nu}_e - e)$

SUMMARY

- ⊙ **TEXONO Collaboration[†]:**
 - ↔ **Built Up & Growing**
 - ⊙ **Kuo-Sheng Neutrino Lab.*:**
 - ↔ **Established & Operational**
 - ↪ **Flexible & Modular design**
 - ↔ **Physics data taking since June 2001**
 - ↪ **Unique HPGe low threshold data**
 - ↪ **Bkg. level ~ Udrgd. CDM expts.**
 - ↔ **Expect results on μ_ν (Γ_ν) soon**
 - ↔ **Preparation for P2 data taking**
 - ↪ **improved HPGe Config.**
 - ↪ **150⁺ kg CsI(Tl)**
- [Welcome Ideas/Comments/Suggestions
for Possibilities Beyond]**
- ⊙ **Diversified R&D Program in Parallel**
-

* **FIRST Particle Physics experiment in Taiwan.**

† **FIRST Research Collaboration among groups from
Taiwan and China.**
