SLS Layout

Green: first phase beamlines
Red: proposed beamlines

Data collection in protein crystallography

Spot size:

- Beam divergence
- Mosaicity of the crystal
- Distance sample-detector
- Point spread function of detector

Diffracted beam

X-ray Detector

Diffraction pattern

Crystal rotation

- 30-180 degree for complete data set
- Currently: Discrete rotation, integration over certain rotation angle
- Future: Continuous rotation, integration determined by detector frame rate (**Fine phi slicing**)

Crystallized Protein

Beam

Beam
Energy: 5-17.5 keV
Intensity: ~10/s
Focal spot size: Adjustable to 25 x 15 μm
Divergency: 150 $\mu\text{rad} \times 28 \mu\text{rad}$ (FWHM)

Resolution:

$$2d \cdot \sin(\theta) = \lambda$$

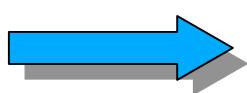

For $d=1\text{\AA}$ and $\theta=60^\circ$

Diffraction data

- reflect crystal symmetry group
- orientation of the crystal \rightarrow orientation matrix
- High dynamic range: >10 between strong and weak reflections
- Intensities need to be determined accurately (1%)
- Determination of amplitudes and phases leads to electron density maps

Detector requirements:

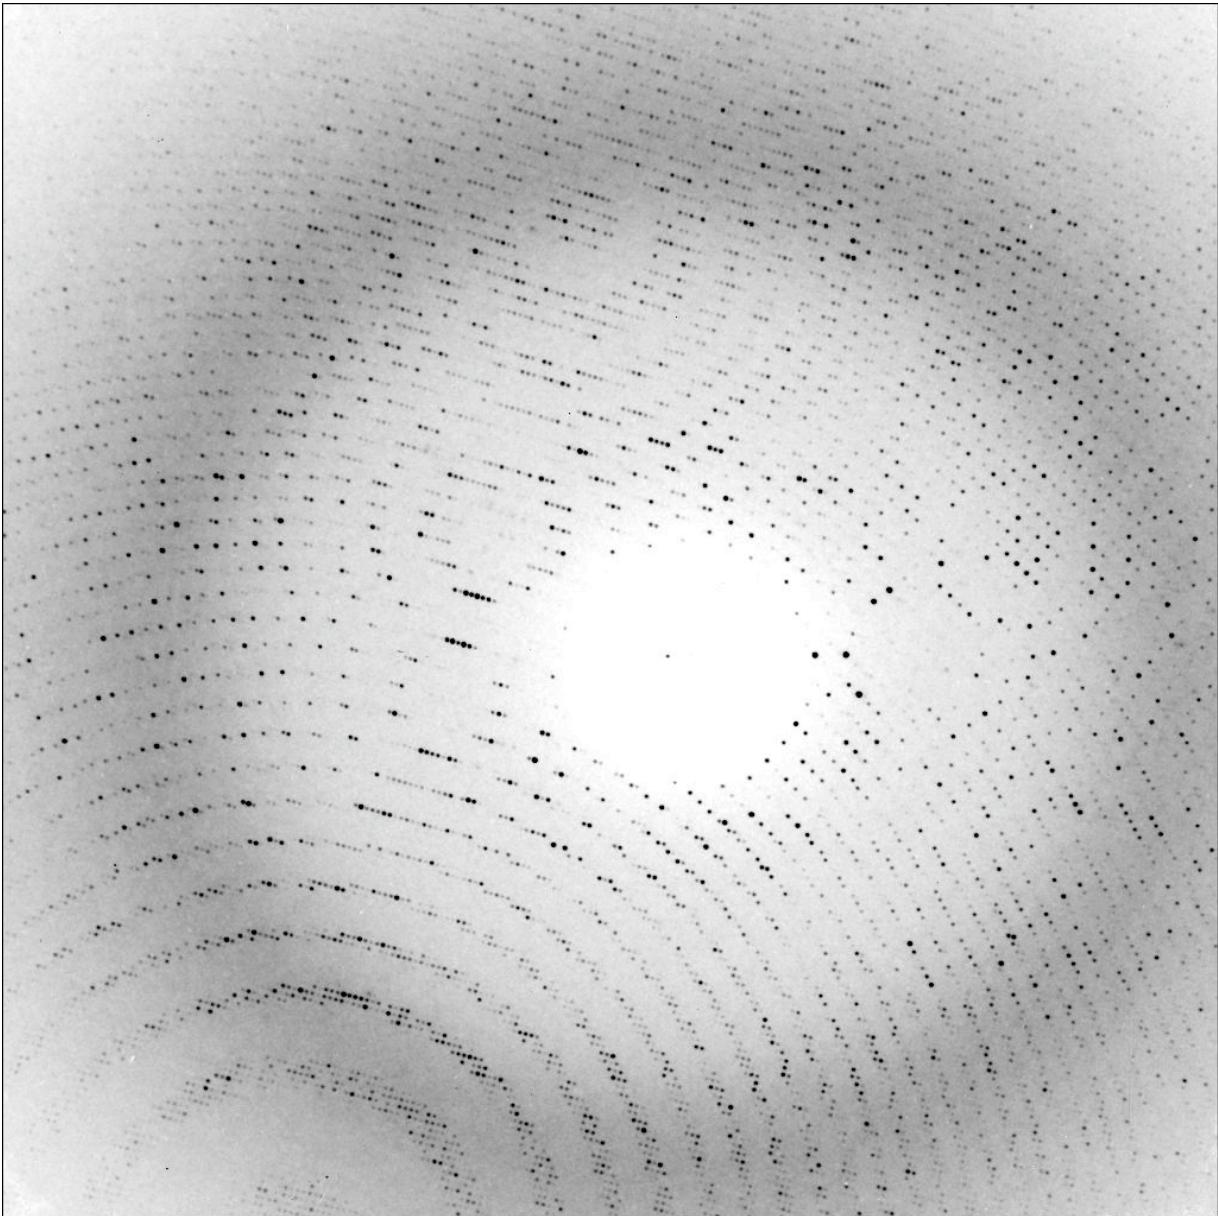

- Large area (40 x 40 cm) and/or large number of pixels
- Detect a high number of reflection orders (>500)
- Accurate determination of integrated intensities
- Wide dynamic range (>16 bit, i.e. single photon counting detector)
- Fast readout (<0.1s)

Pixel Detectors

X-Ray Diffraction From A \square X-174 Virus Crystal

Macromolecular Crystallography

Determine the structure of highly complex molecules to atomic resolution

Molecular Weight > 1 MDa
(> 50,000 atoms)

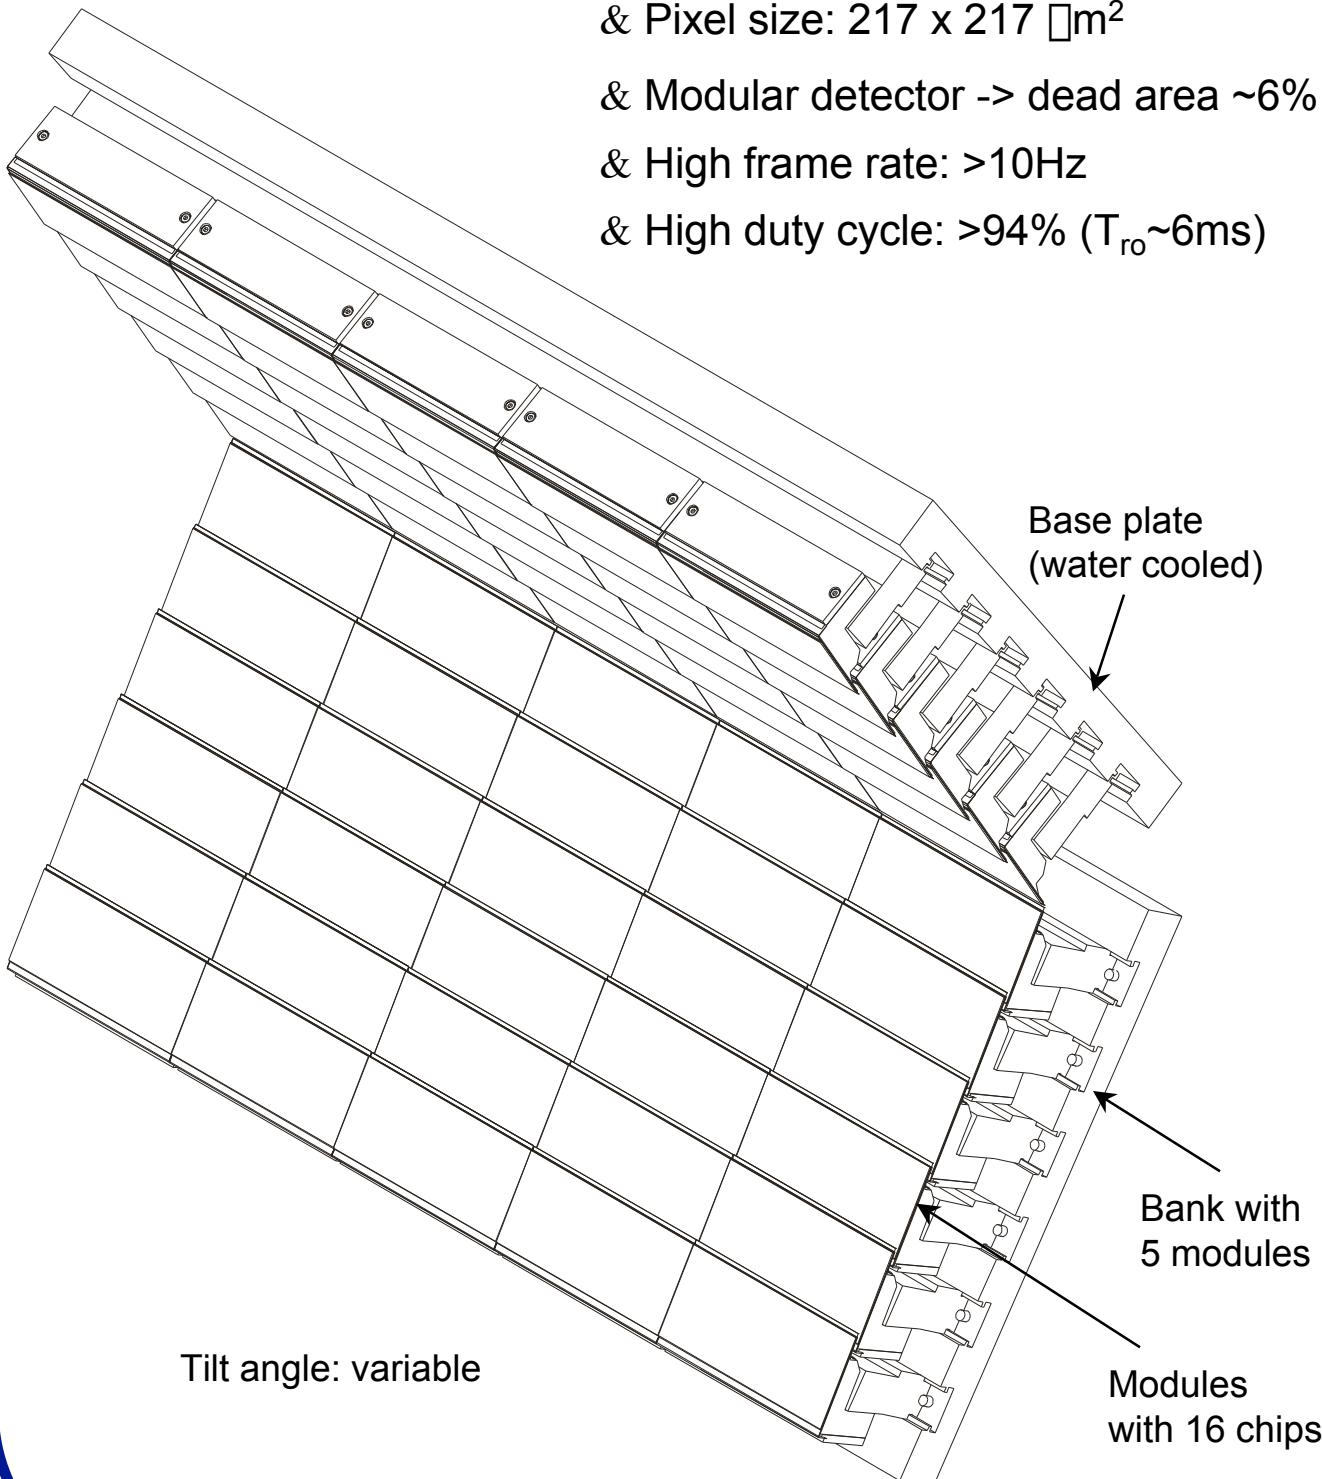

Applications:

- Enzymes
- Viruses
- Catalytic mechanisms
- Electron transport
- Energy transduction
- Motility
- Drug Design
- Structural genomics

The SLS Pixel Detector

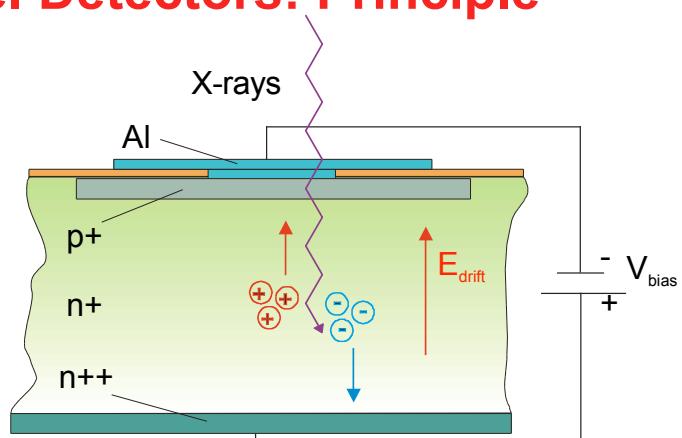

- & Size: $40 \times 40 \text{ cm}^2$ (0.16 m^2)
- & 2000×2000 pixels
- & Pixel size: $217 \times 217 \mu\text{m}^2$
- & Modular detector -> dead area $\sim 6\%$
- & High frame rate: $>10\text{Hz}$
- & High duty cycle: $>94\%$ ($T_{ro} \sim 6\text{ms}$)

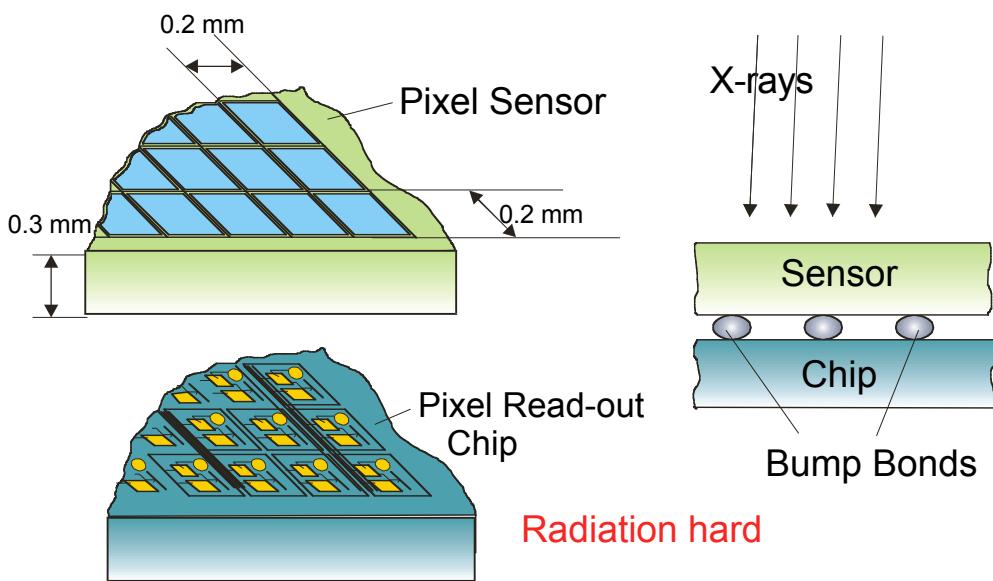

Pixel Detectors: Principle

Si pn-junction

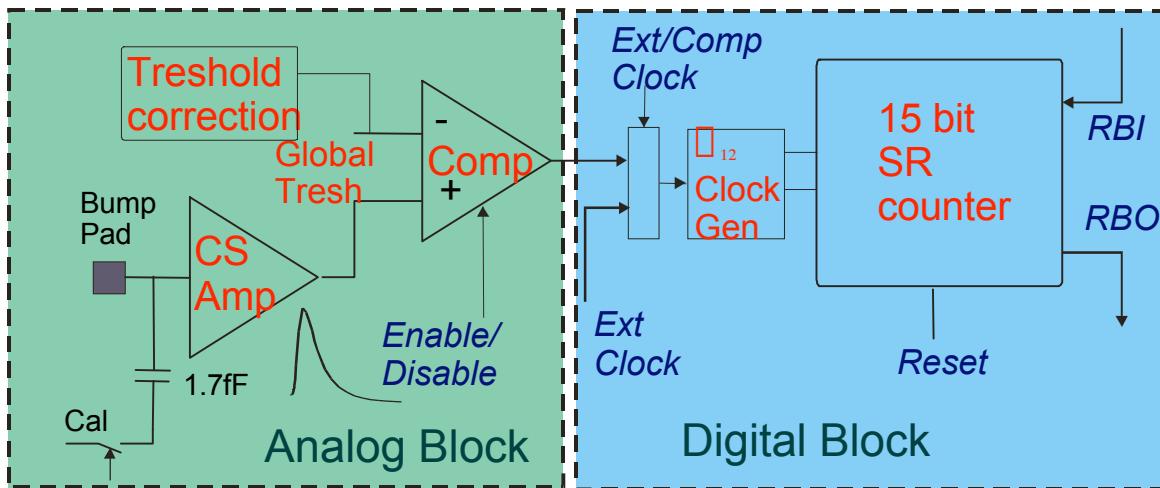

3.6 eV to create
1 eh-pair

Detector

Pixel electronics

Slide 15: Flat-field Correction

Slide 18: Continuous Fine \square -Slicing

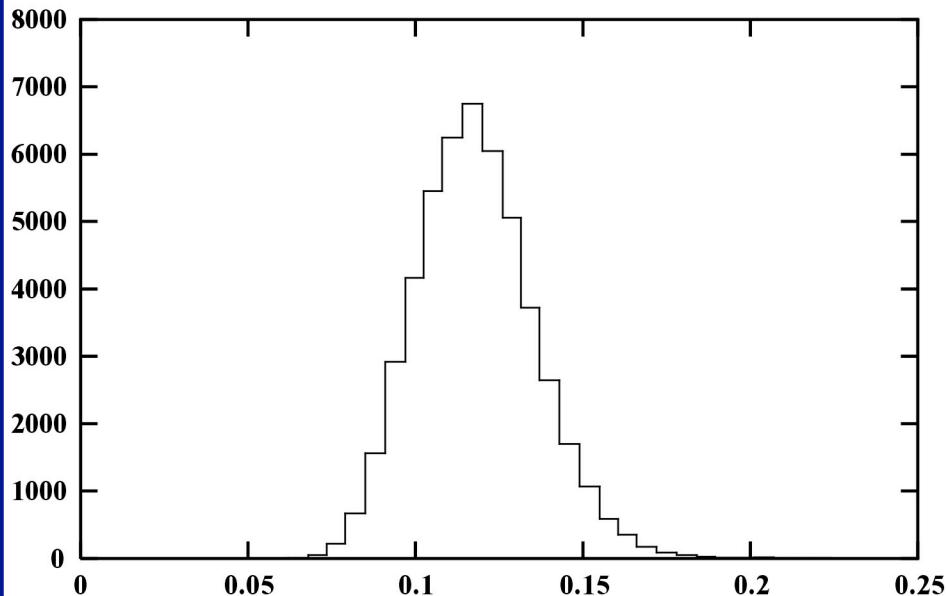

Slide 19: Lysozyme: MOSFLM Autoindex

Slide 20: Lysozyme: MOSFLM Refined Cell

Trimming A Module With A Global Vcmp

mod1_v, trim = 0

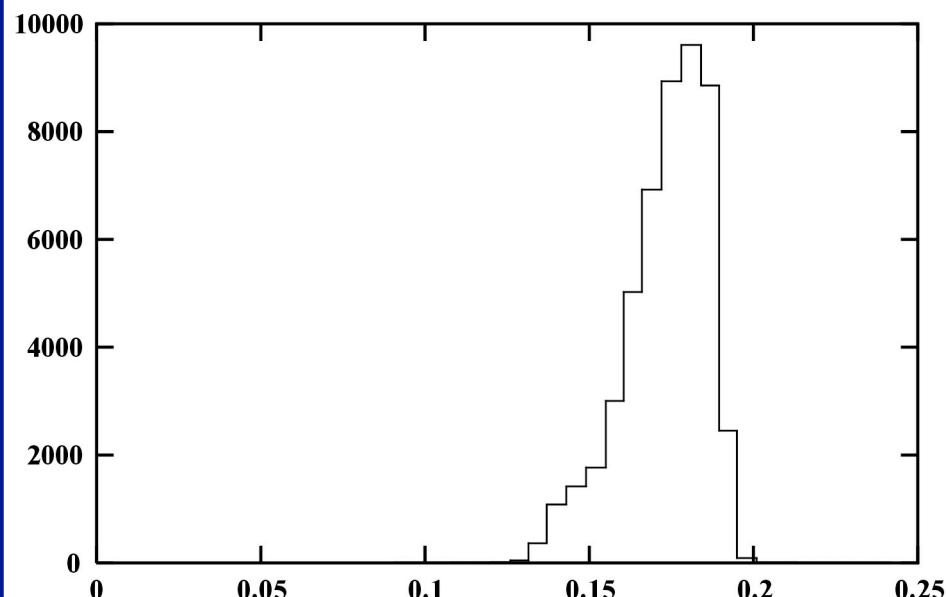

N pixels = 49641

Avg. threshold = 1120 e-

RMS = 181 e-

mod1_v, trim = autotrim

Trim target = 1800 e-

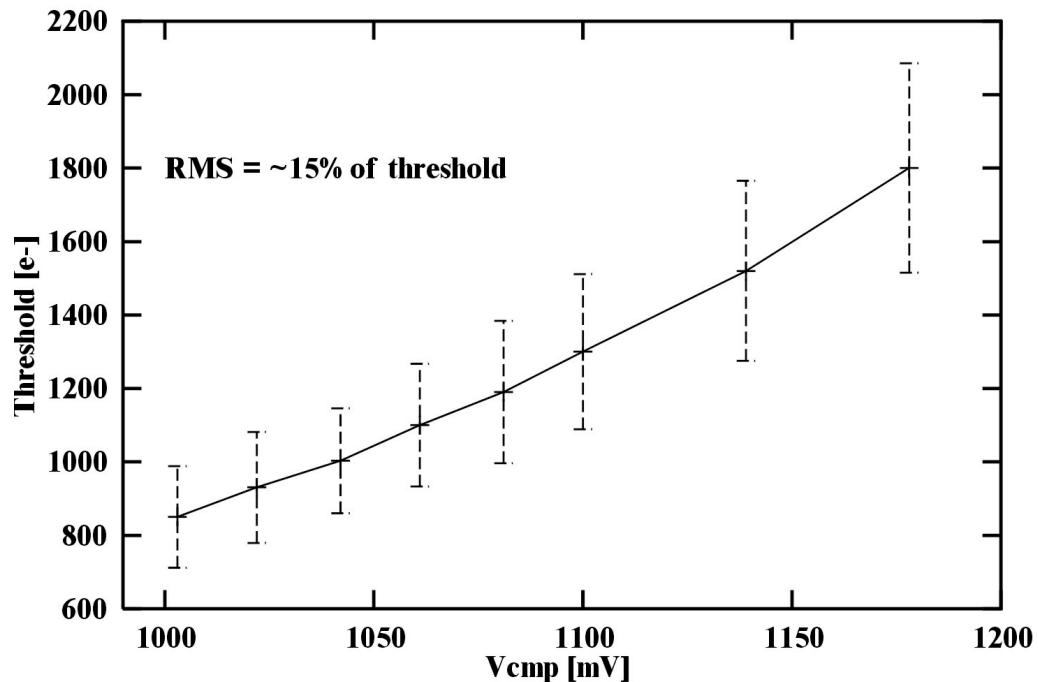

Avg. threshold = 1680 e-

RMS = 132 e-

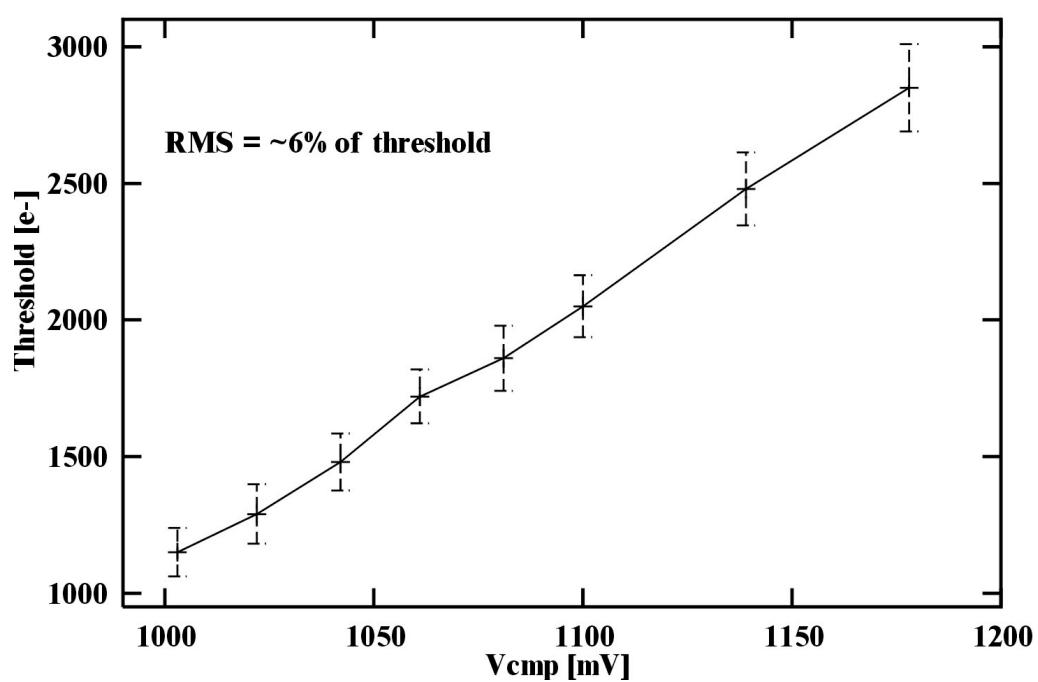

Threshold vs. Vcmp

Untrimmed

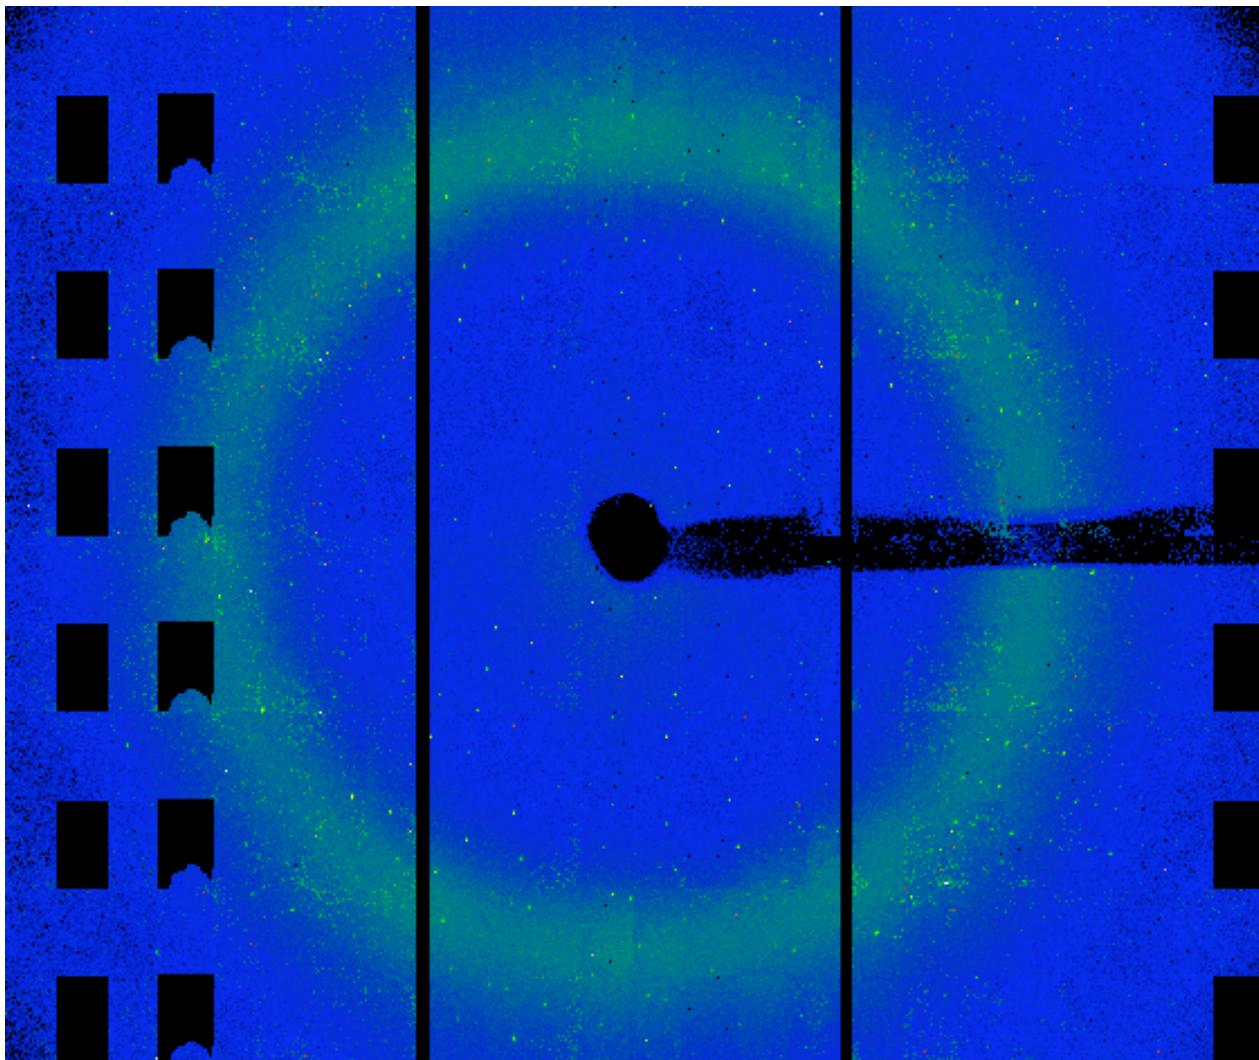

Trimmed

PILATUS Detector Crystallography

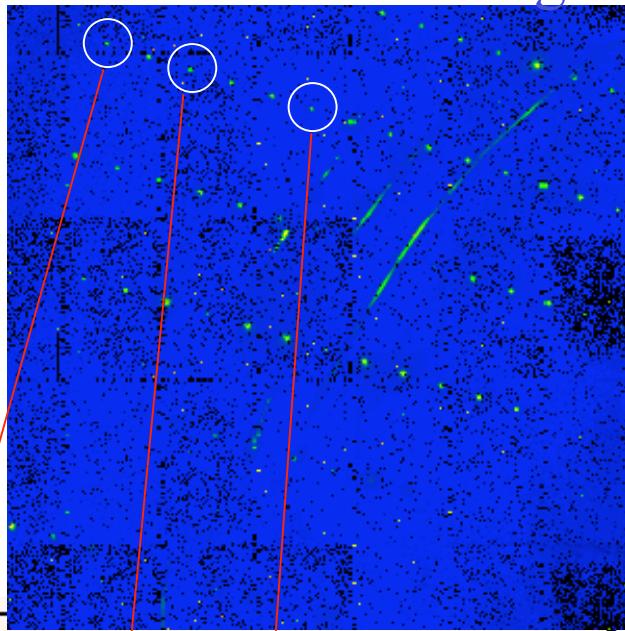

Lysozyme
1° rotation
2 s exposure

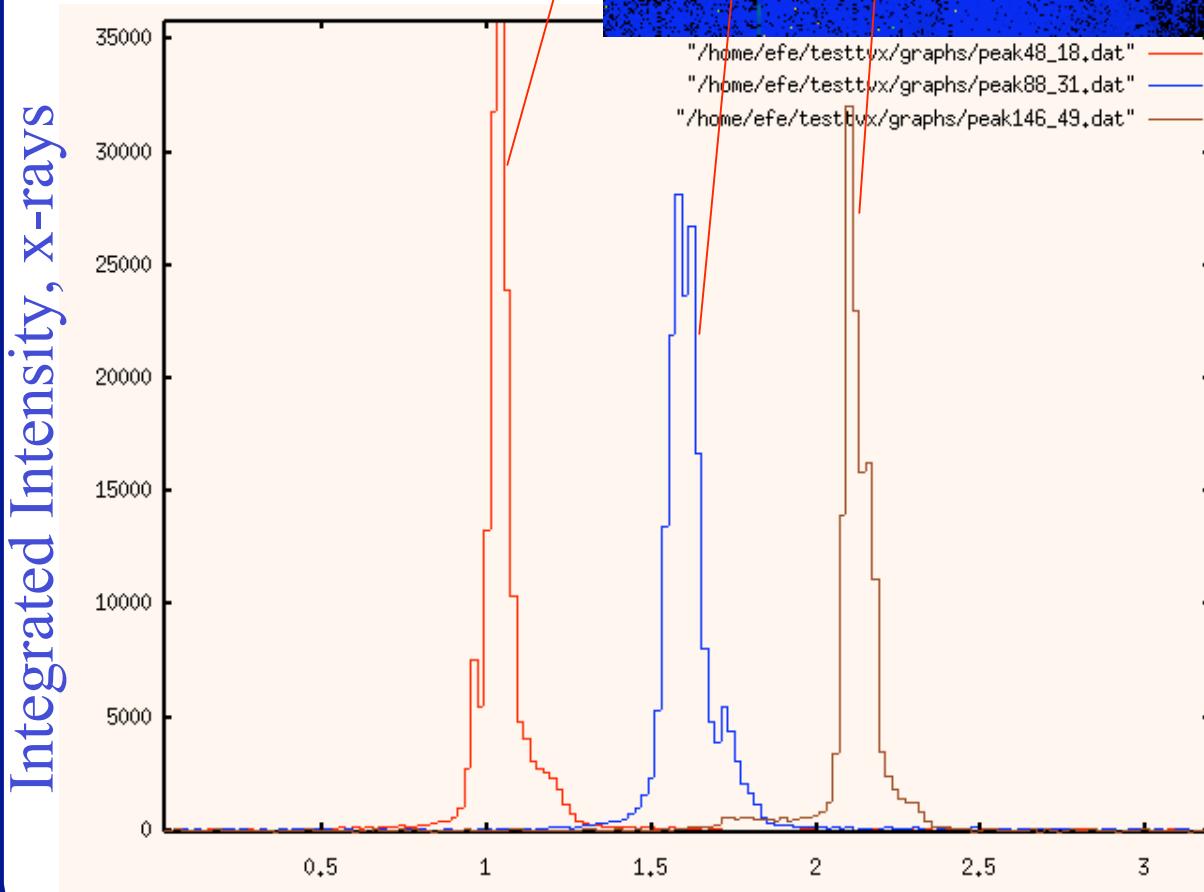

Fine \square -Slicing with PILATUS

1.5° Rotation Image

Lysozyme:
0.02° steps
0.5 s exposure
FWHM:
0.06° - 0.10°

Rotation Angle (\square), deg.

SLS 2k × 2k Pixel Detector

PIXEL:

$217 \times 217 \mu\text{m}^2$

Preamplifier and shaper

Threshold discriminator with 4-bit trim

15-bit counter

$>10^5$ x-ray/s

CHIP:

CMOS 0.8 μm DMILL rad-hard

Designed at PSI

44×78 pixels, $9.9 \times 18.3 \text{ mm}^2$

Read out at 10 MHz

MODULE:

Fully depleted diode array

$81 \times 36.6 \text{ mm}^2 \times 300 \mu\text{m}$, 57,462 pixels

Indium bump-bonded to 16 chips

Chips read out in parallel (5 ms)

Module control board

BANK:

5 modules

Bank control board caches data

DETECTOR:

12 banks

Adjustable V-shape

With fine-slicing, a 180° rotation may produce
2000 8 MB images (16 GB) in ~3 min.
