Supersymmetry Parameter Analysis with Fittino

Philip Bechtle (SLAC)

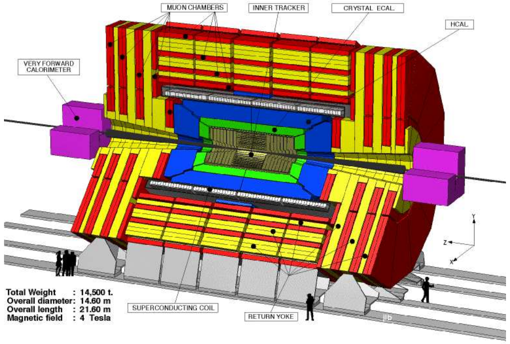
Klaus Desch (Univ. Freiburg)

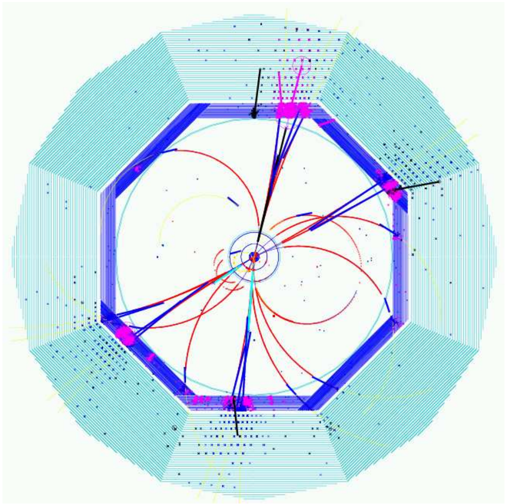
Peter Wienemann (DESY)

LCWS 05, Stanford, 19.03.2005

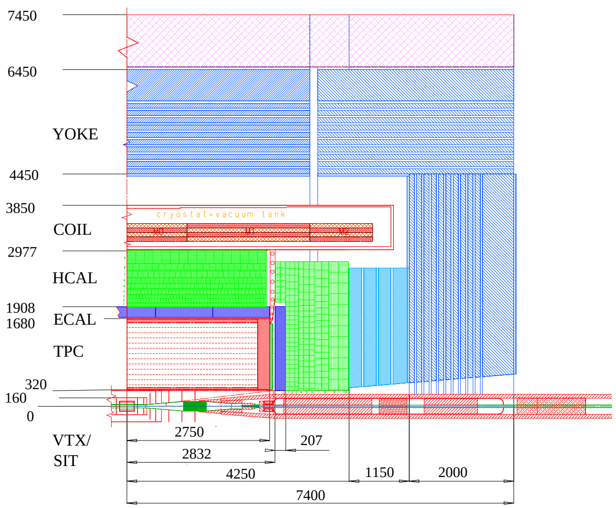
Outline

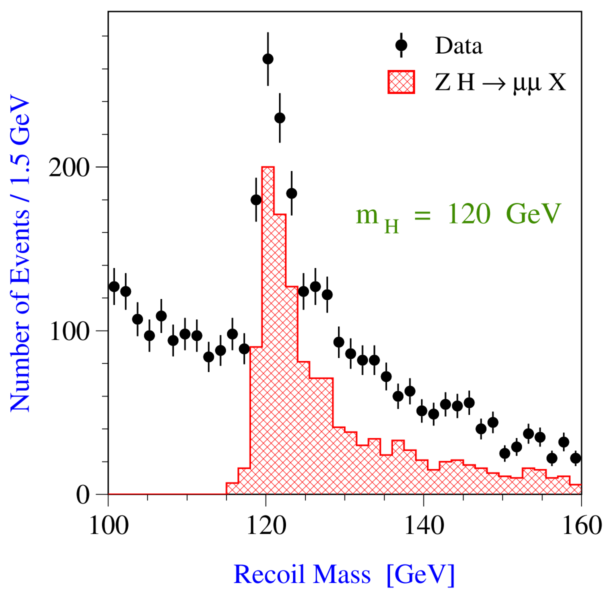
- Motivation and introduction to Fittino
- Parameter determination in Fittino
- Fittino results using ILC and LHC observables
- One more very convincing reason why life without the ILC is very boring
- Conclusions



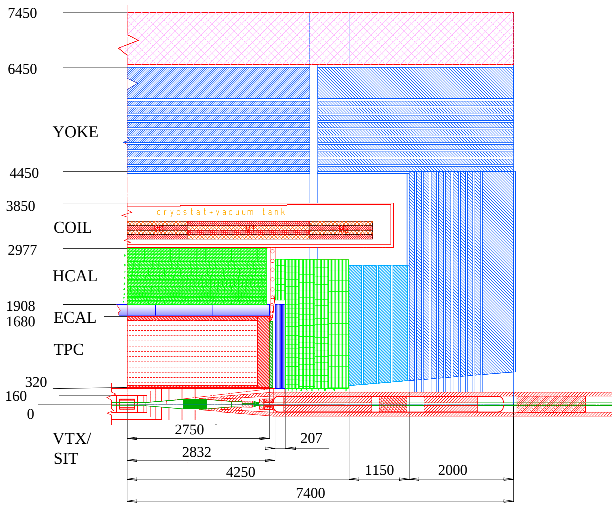


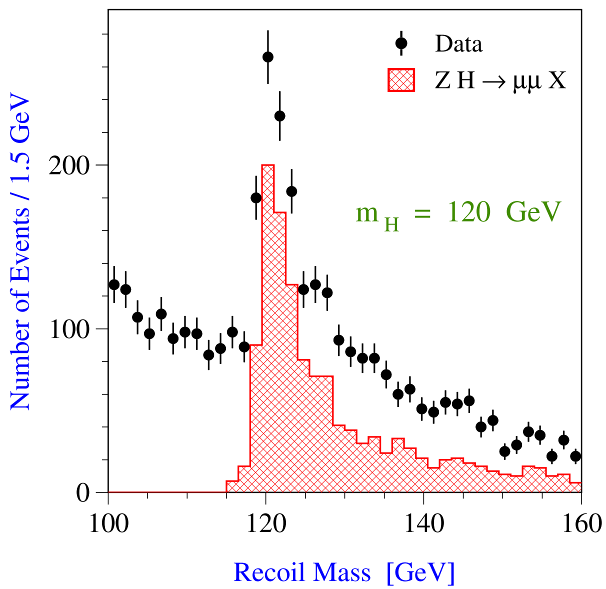
Linking Measurements and Theory



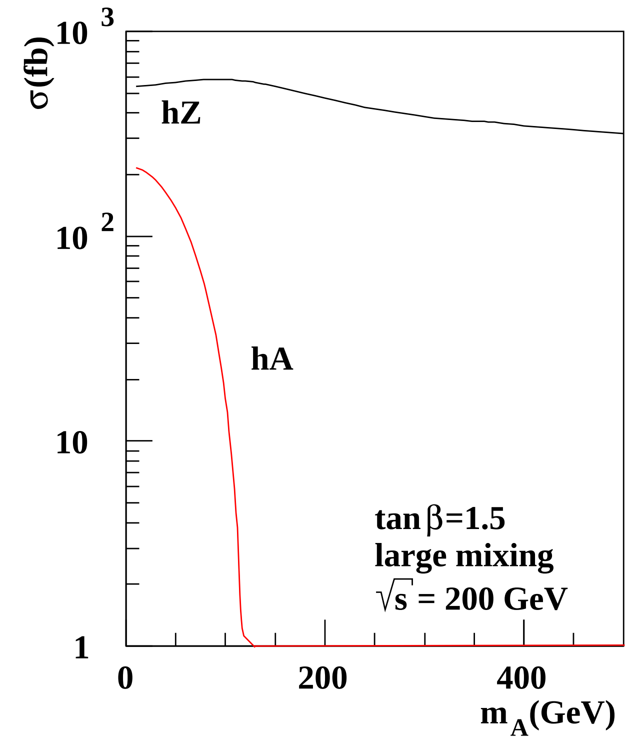


Linking Measurements and Theory

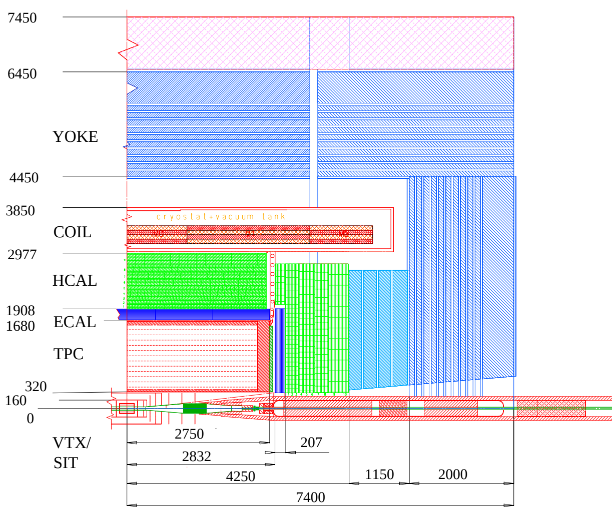


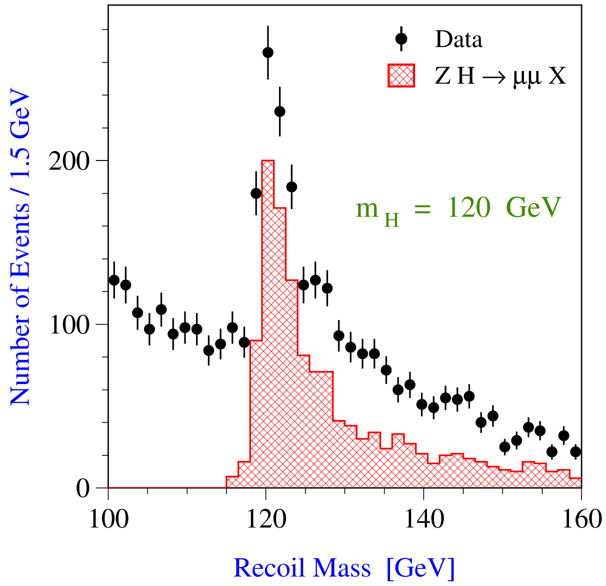


$$
\begin{aligned}
V_{\text{Higgs}} &= m_{1H}^2|H_1|^2 + m_{2H}^2|H_2|^2 \\
&\quad -m_{12}^2(\epsilon_{ij}H_1^iH_2^j + h.c.) \\
&\quad +\frac{1}{8}(g^2+g'^2)(|H_1|^2 - \\
&\quad |H_2|^2)^2 + \frac{1}{2}g^2|H_1^*H_2|^2
\end{aligned}
$$



Linking Measurements and Theory

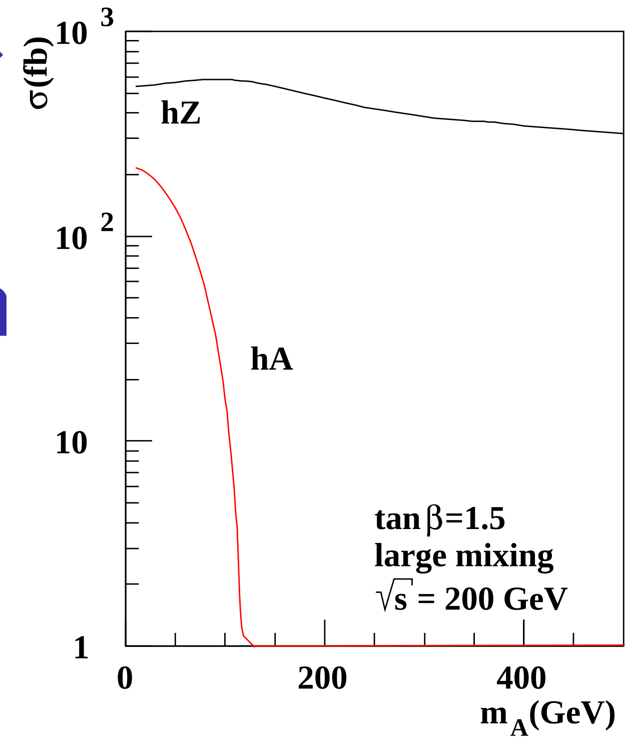




$$
\begin{aligned}
V_{\rm Higgs} &= m_{1H}^2|H_1|^2 + m_{2H}^2|H_2|^2 \\
&\quad - m_{12}^2(\epsilon_{ij}H_1^iH_2^j + h.c.) \\
&\quad + \frac{1}{8}(g^2+g'^2)(|H_1|^2 - \\
&\quad |H_2|^2)^2 + \frac{1}{2}g^2|H_1^*H_2|^2
\end{aligned}
$$

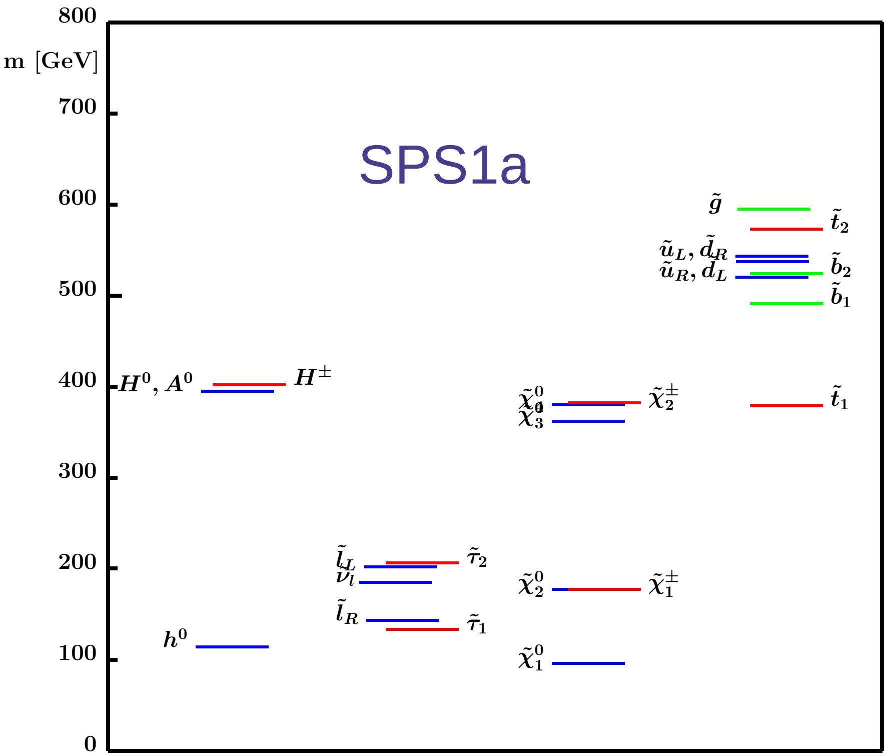
Link:

Parameter Determination



MSSM Physics at the ILC

- Higgs physics:
  - light Higgs mass precision $\approx 50\,\mathrm{MeV}$
  - light Higgs BR $\approx 2\,\%$
  - Discovery of heavy Higgs bosons $> 400\,\mathrm{GeV}$
- Sleptons: $\Delta m_{\tilde{\mu}_R} = 0.2\,\mathrm{GeV}$
- Gauginos: $\Delta m_{\chi_1^\pm} = 0.5\,\mathrm{GeV}$
- Squarks: $\Delta m_{\tilde{t}_1} = 2\,\mathrm{GeV}$
- + precise analysis of quantum numbers (Higgs parity...)
- + precise analysis of couplings from BR and σ
- indirect prediction of particle masses (LHC/ILC interplay)
- Precision of interpretation has to match precision of measurement



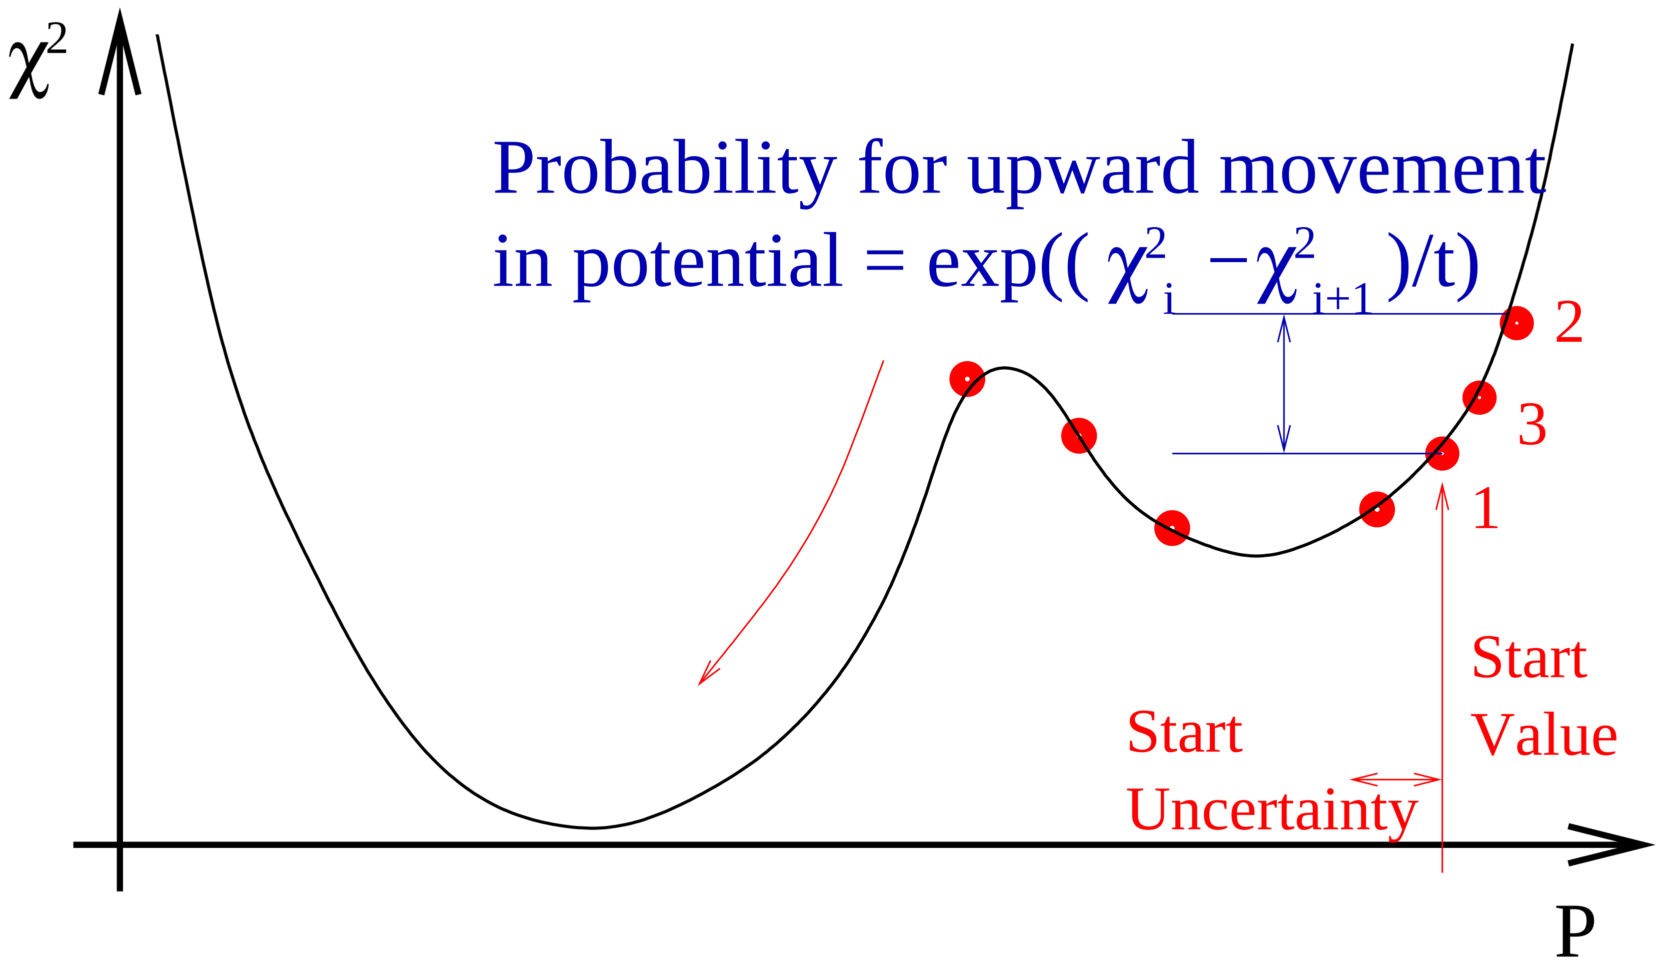
The Fit Program Fittino

- Determine the low-energy MSSM Lagrangian parameters from the observables from the ILC and LHC in a global fit
- Use full theoretical precision, all available loop effects
- Bottom-up approach, no assumption on SUSY breaking mechanism
- To be unbiased: Use no prior knowledge of the parameters at any step
- Provide easy user interface for measurements, parameter definitions and output
- Goals:
  - Unambiguous parameter determination without human bias?
  - Determine precision of parameter measurements
  - Test the necessary experimental and theoretical precision
- More information in `http://www-flc.desy.de/fittino/`
- Similar Program: SFitter by R. Lafaye, T. Plehn and D. Zerwas

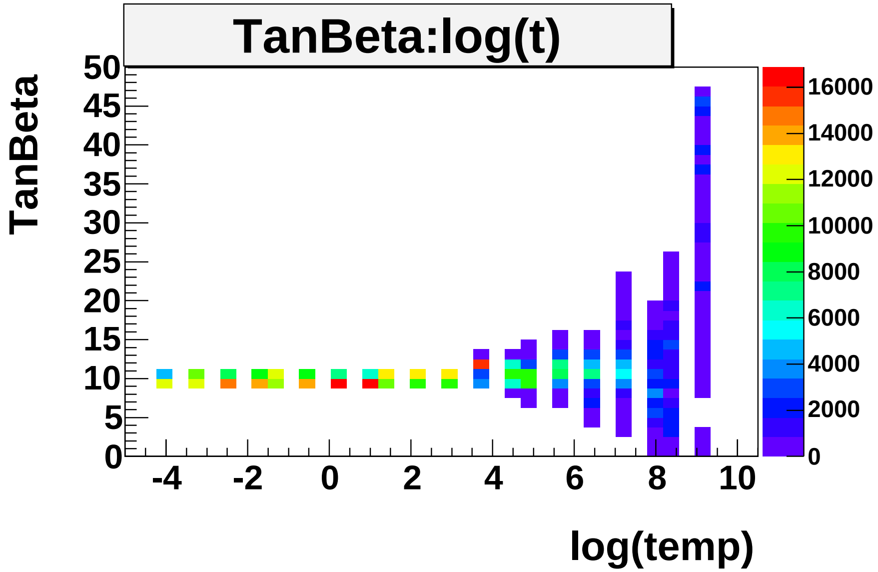
The Iterative Fit Procedure

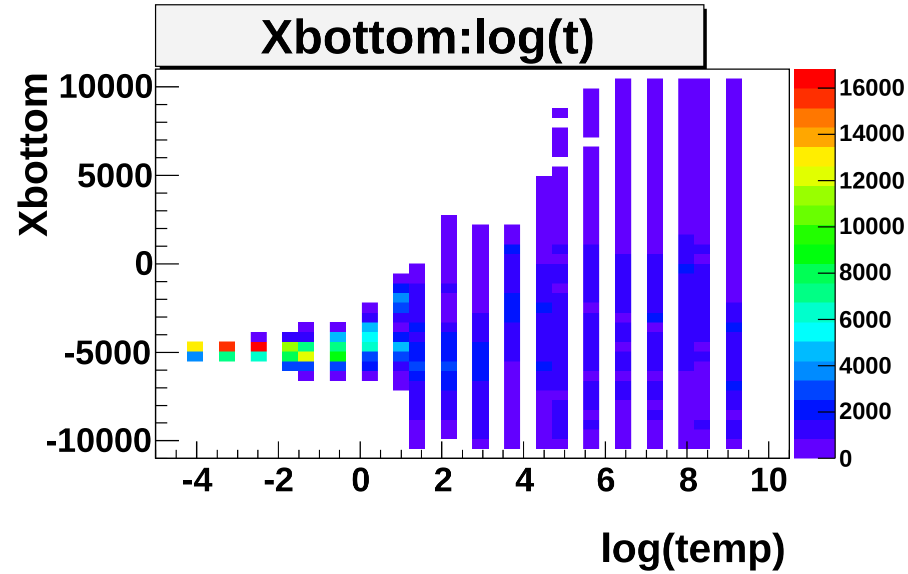
- Challenge: A χ^2 fit with ≈ 20 parameters probably does not converge without good start values
- Solution: Iterative fit procedure
  - Tree-level estimates of parameters P_i from observables O_j
  - Subsector fits or simulated annealing to approach/find minimal χ^2
  - Global fit to refine minimum and find global parameter uncertainties and correlations
- Additional Features of Fittino:
  - Pulls: Determine χ^2 and pull distributions from toy experiments independent check of uncertainties, biases and correlations
  - Determination of most important observables for each parameter determination
  - 2d scans and uncertainty contours

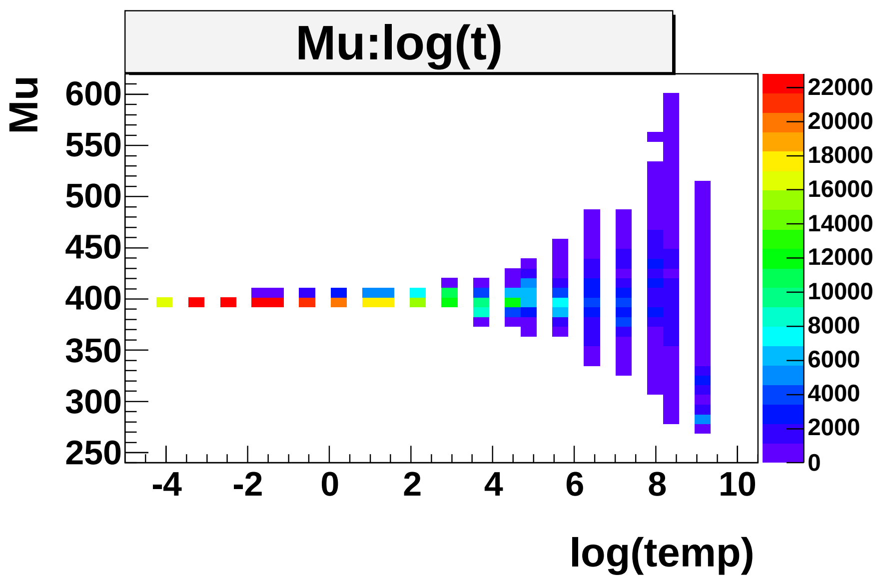
Simulated Annealing

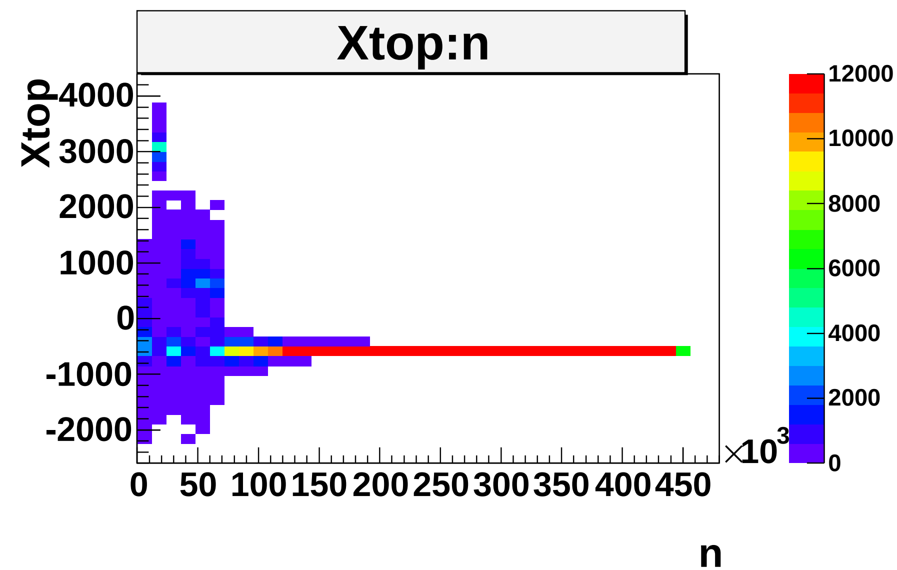


Variable parameter scan









The SPS1a' Fit: Inputs

- Observables: for the SPS1a' scenario:
  - SM observables $m_Z, m_W, G_F, m_t, \ldots$
  - Higgs sector masses from 500 GeV and 1 TeV ILC
  - All accessible sparticle and gaugino masses from LHC and ILC with realistic uncertainties (`hep-ph/0410364`)
  - ILC $\sigma \times \mathrm{BR}$ at 400,500,1000 GeV, polarisation LR, RL, LL and RR
  - absolute h BR's and σ (`hep-ph/0106315`)
- Assumptions for this test:
  - Unification in the first two generations, no complex phases, no squark mixing across flavours
- Two fits:
  - No theory uncertainty
  - Theory uncertainty on all masses and $2\times$ larger σ uncertainties
- Use SPheno (by W. Porod) as SUSY calculator

		$\sigma(\mathrm{e}^-_L\mathrm{e}^+_R \to \tilde{\mathrm{t}}^-_1\tilde{\mathrm{t}}^+_1 \to \chi^0_1\tau^-\bar{\nu}_\tau\mathrm{\bar{b}}\,\chi^0_1\tau^+\nu_\tau\mathrm{b})$ 1 TeV	0.13

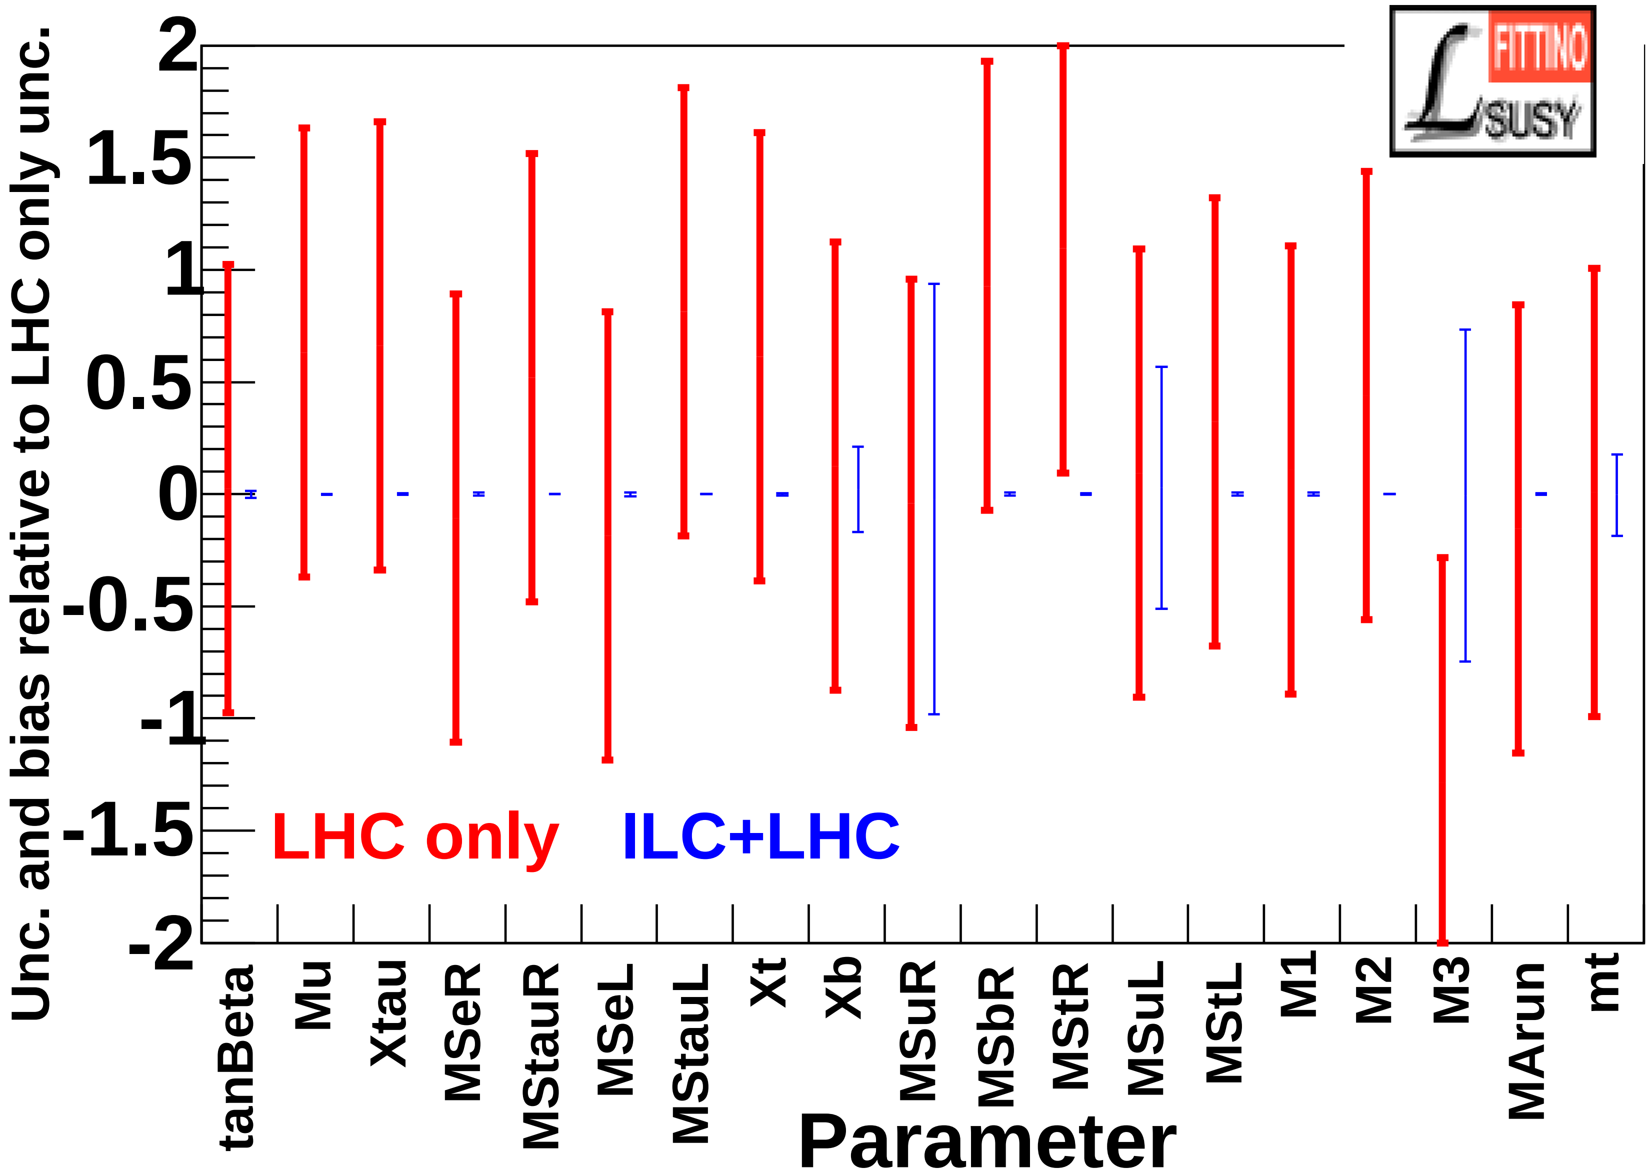
Comparison of LHC and ILC+LHC

For SPS1a':

Compare the ability of LHC only and ILC+LHC to understand what is discovered:

- Use ILC+LHC inputs and results as before
- For the LHC (considered as LHC friendly assumptions):
  - SM observables as before
  - Mass measurements and precision as in LHC/ILC report `hep-ph/0410364`
  - + χ_1^+ mass measurement and precision from G. Polesello *et al* `hep-ph/0312318`
  - Ratios of Higgs branching fractions from M. Dührssen ATLAS Note
- Then plot relative size of uncertainties (RMS of toy fits) and bias (LHC only uncertainties normalized to 1, biases and ILC+LHC uncertainties normalized accordingly)

Comparison of LHC and ILC+LHC



Conclusions

- Fittino measures SUSY Lagrangian parameters using many LHC and ILC observables, taking loop-corrections into account
- Fittino uses tree-level estimates, subspace fits and Simulated Annealing, allows to find the correct parameters in highly complex parameter space
- Lessons from Fittino:
  - Parameter determination is possible (non-trivial!)
  - Precise analysis of SUSY parameters requires high ILC precision
  - Theoretical Uncertainties can strongly affect parameter uncertainties
  - Fittino can be used to identify regions with need of theoretical or experimental improvements
  - Fittino could be used to optimize $\mathcal{L}(\sqrt{s}, \mathrm{pol.})$
- Fittino is available from `http://www-flc.desy.de/fittino`, see also `hep-ph/0412012`
- ILC + LHC can be the era of deeper understanding of new physics

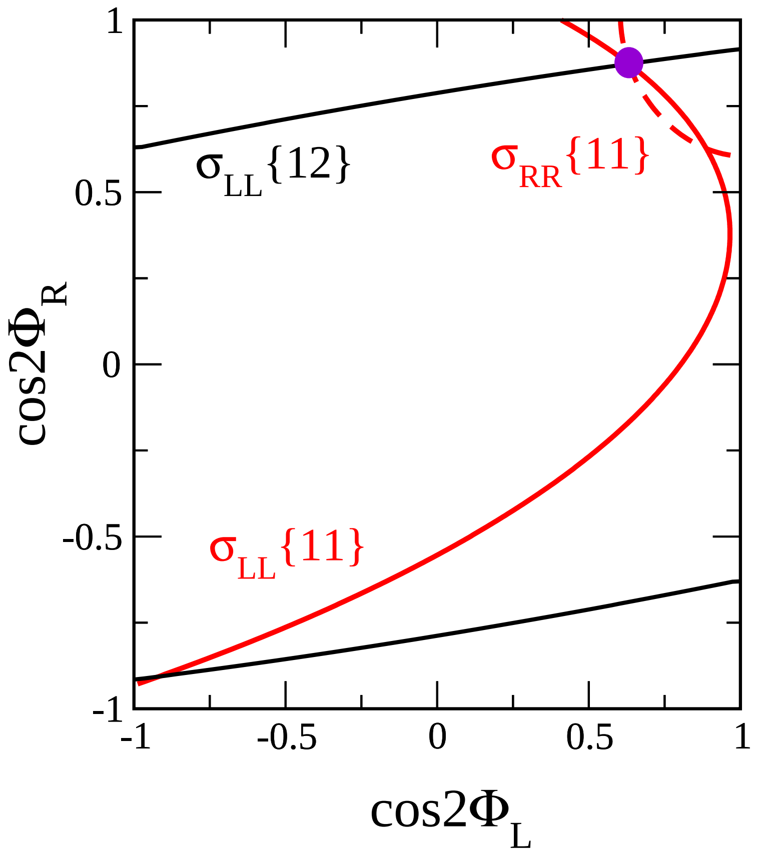
Tree-Level Estimates: Gaugino Sector



from Zerwas *et al*, hep-ph/0211076

- Measure chargino and Neutralino masses
- Use the chargino cross-sections at different beam polarisations to determine the *pseudo-observables* $\cos 2\phi_L$, $\cos 2\phi_R$ (Chargino mixing angles)

$$|\mu| = m_W \left(\Sigma + \Delta(\cos 2\phi_L + \cos 2\phi_R)\right)^{\frac{1}{2}}$$

$$\tan\beta = \left(\frac{1 + \Delta(\cos 2\phi_R - \cos 2\phi_L)}{1 - \Delta(\cos 2\phi_R - \cos 2\phi_L)}\right)^{\frac{1}{2}}$$

$$M_2 = m_W \left(\Sigma - \Delta(\cos 2\phi_L + \cos 2\phi_R)\right)^{\frac{1}{2}}$$

$$M_3 = m_{\tilde{g}}$$

$$\Sigma = (m^2_{\chi^\pm_2} + m^2_{\chi^\pm_1})/2m^2_W - 1$$

$$\Delta = (m^2_{\chi^\pm_2} - m^2_{\chi^\pm_1})/4m^2_W$$

- Get M_1 from neutralino system

The Slepton and Squark Sector

- Problem: hard to get 3rd gen. squark mixing on tree-level
- Estimate squark and slepton mass parameters with assumption $A = 0$:

$$
\begin{aligned}
M_{\tilde{t}_L} &= -m_Z{}^2 \cos 2\beta(\frac{1}{2} - \frac{2}{3}\sin^2\theta_W) - m_t^2 + \frac{1}{2}(m_{\tilde{t}_1}^2 + m_{\tilde{t}_2}^2) \\
&= m_Z{}^2 \cos 2\beta(\frac{1}{2} - \frac{1}{3}\sin^2\theta_W) - m_b^2 + \frac{1}{2}(m_{\tilde{b}_1}^2 + m_{\tilde{b}_2}^2) \\
M_{\tilde{t}_R} &= -m_Z{}^2 \cos 2\beta\frac{2}{3}\sin^2\theta_W - m_t^2 + \frac{1}{2}(m_{\tilde{t}_1}^2 + m_{\tilde{t}_2}^2) \\
M_{\tilde{b}_R} &= m_Z{}^2 \cos 2\beta\frac{1}{3}\sin^2\theta_W - m_b^2 + \frac{1}{2}(m_{\tilde{b}_1}^2 + m_{\tilde{b}_2}^2) \\
X_t &= -\mu/\tan\beta \\
X_b &= -\mu\tan\beta
\end{aligned}
$$

- Slepton sector treated analogously
