Abstract

$\bar{K}NN$ three body resonance has been studied by $\bar{K}NN - \piYN$ coupled channel Faddeev equation. The S-matrix pole has been investigated using the scattering amplitude on the unphysical Riemann sheet. As a result we found a three-body resonance of strange dibaryon system with the binding energy $B \sim 79\text{MeV}$ and the width $\Gamma \sim 74\text{MeV}$.

1 Introduction

The meson-nucleus bound state has been an important tool to study the meson properties inside the nuclear medium. The $\bar{K}$-nuclear system is particularly interesting because of the $I = 0$ resonance $\Lambda(1405)$ below the $\bar{K}N$ threshold. The attractive nature of the kaon-nucleus interaction obtained from the analysis of the kanonic atom [1] might be largely related to the $\Lambda(1405)$. In a few nucleon system, where one hopes to learn about the kaon-nucleon interaction with less ambiguity on nuclear many body dynamics, possible deeply bound states of the kaon in nuclei have been proposed by Akaishi and Yamazaki [2]. The predicted binding energy $B$ and width $\Gamma$ of the smallest nuclear system $K^-pp$ is $(B, \Gamma) = (48, 61)\text{MeV}$. FINUDA collaboration reported a signal of the $K^-pp$ bound state from the analysis of the invariant mass distribution of $\Lambda - p$ in the $K^-$ absorption reaction on nuclei [3]. The reported central value of the binding energy is $(B, \Gamma) = (115, 67)\text{MeV}$.

The binding energy of $K^-pp$ resonance will be strongly influenced by the dynamics of the $\Lambda(1405)$ resonance. For the resonance interaction in a few body system, it will be very important to take into account fully

the kaon-nucleon dynamics in the $\mathcal{KNN}$ system including the decay of the $\Lambda(1405)$ into the $\pi\Sigma$ state. The purpose of this work is to study the strange dibaryon system by taking into account the three-body dynamics using the $\mathcal{KNN} - \piYN$ coupled channel Faddeev equation with the relativistic kinematics. The resonance can be studied from the pole of the S-matrix or scattering amplitude [4]. We briefly explain our procedure to search the three-body resonance in Sec. 2. The structure of the $\Lambda(1405)$ has been a long standing issue. The chiral Lagrangian [5] approach is able to describe well the low energy $\mathcal{KN}$ reaction. In this work, we describe a $\mathcal{KN} - \pi\Sigma$ state using the s-wave meson-baryon potentials guided from the lowest order chiral Lagrangian. The model of the two-body meson-baryon interaction used in this work is explained in Sec. 3. We report our result on the $\mathcal{KNN}$ dibaryon resonance in Sec. 4. This work is based on our previous works(see Refs. [6]).

2 AGS equation and resonance pole

Our starting point is the Alt-Grassberger-Sandhas(AGS) equation [7] for the three-body scattering problem. It is possible because all of our two-body interactions are separable forms. The AGS equation for the three-body scattering amplitude $X_{i,j}$ is given as

$$X_{i,j} = (1 - \delta_{i,j})Z_{i,j} + \sum_{n \neq i} \int dp_n Z_{i,n} \tau_n X_{n,j}. \quad (1)$$

Here we represent the spectator particle $i = 1, 2, 3$ and the interacting particles $j, k$. Scattering t-matrix for particle $j, k$ is denoted as an isobar propagator $\tau_i$ and a driving term $Z_{i,j}$ denotes the particle exchange interaction. After anti-symmetrizing the amplitude for two nucleons [8] and the partial wave expansion of the amplitude restricting s-wave, the AGS-equation reduces into the following coupled integral equation,

$$X_{l,m}(p_l, p_m) = Z_{l,m}(p_l, p_m) + \sum_n \int dp_n p_n^2 K_{l,n}(p_l, p_n) X_{n,m}(p_n, p_m). \quad (2)$$

Here we used simplified notation for the kernel $K = Z\tau$. The AGS-equation of Eq. (2) is the Fredholm type integral equation with the kernel $K = Z\tau$. Using the eigenvalue $\eta_a(W)$ and the eigenfunction $|\phi_a(W)\rangle$ of the kernel for given energy $W$, the scattering amplitude $X$ can be written as

$$X = \sum_a \frac{|\phi_a(W)\rangle\langle\phi_a(W)|Z}{1 - \eta_a(W)}. \quad (3)$$

At the energy $W = W_p$ where $\eta_a(W_p) = 1$, the amplitude has a pole and therefore $W_p$ gives the bound state or resonance energy.

3 Two-body ingredients

In this section, we explain our model of the most important $KN$ interaction. We start from the leading order chiral effective Lagrangian, and the meson-baryon potential can be written as

$$<p', \alpha|V_{BM}|p, \beta> = -C_{\alpha, \beta} \frac{1}{(2\pi)^3 F_\pi^2} \frac{E_{M'}(p') + E_M(p)}{\sqrt{4E_{M'}(p')E_M(p)}} \times v_\alpha(p')v_\beta(p).$$ (4)

Here $p$ and $p'$ are the momentum of the meson in the initial state $\beta$ and the final state $\alpha$. The strength of the potential at zero momentum is determined by the pion decay constant $F_\pi$. The relative strength among the meson-baryon states is given by the constants $C_{\alpha, \beta}$, which are $C_{KN-KN} = 6$, $C_{KN-\pi\Sigma} = \sqrt{6}$ and $C_{\pi\Sigma-\pi\Sigma} = 8$. The only parameter of our model is cut off $\Lambda$ of the phenomenologically introduced vertex function $v_\alpha(p) = \Lambda_\alpha^4/(p^2 + \Lambda_\alpha^2)^2$. The cut off $\Lambda$ is determined so as to reproduce the scattering length of $KN$ given by Martin [9], which is summarized in Refs. [6]. In $I = 0$ channel, our model has a resonance. Our model predicts that the pole energy of the $\Lambda(1405)$ is $1420 - i30$ MeV. Our model give satisfactory description of the total cross section of $K^-p$ reaction at low energy shown in Fig. 1.

4 Result and Discussion

We have searched the resonance pole of the strange dibaryon ($J^P = 0^-, I = 1/2$) using the method described in Sec. 2 and the $KN$ interaction explained in Sec. 3. $NN$ interaction for $^1S_0$ channel and $\pi N$ interaction are included in the AGS-equation. However $YN$ interaction is not included in this work.

Our result of the $KN\pi - \pi YN$ resonance pole energy is $W = M - i\Gamma/2 = 2m_N + m_K - 79.3 - i37.1$ MeV. Our resonance has deeper binding energy and similar width compared with the prediction of Ref. [2]. Recently Shevchenko et al. [11] studied $K^-pp$ system using coupled channel Faddeev equation with nonrelativistic kinematics. Their result is almost consistent with ours.
