

Dbs @ SLAC

one part of the picture

There will be only one fmx database, and it will be at SLAC.

MOOT needs to access it, as well as its own internal dbs, for any operation connected with creation or upload of Config.

Might as well have only a single internal MOOT dbs also and locate it at SLAC. Whatever procedures and protocols are agreed upon for the fmx dbs can be used for it also.

There will be no direct access to MOOT's dbs; may only use MOOT services. MOOT is portable, but to be useful must have network access to SLAC.
