

Delegates (mini version)

Delegates are meant to partition the configuration along boundaries natural to an operator; ideally information in one box would be managed by one person or group. That feature has been largely ditched for this mini version, intended primarily to support LCI runs.

Software config is somewhat lower priority than the others since it is likely to be stable. It would include at least filter config and calorimeter pedestals.

FSW Files

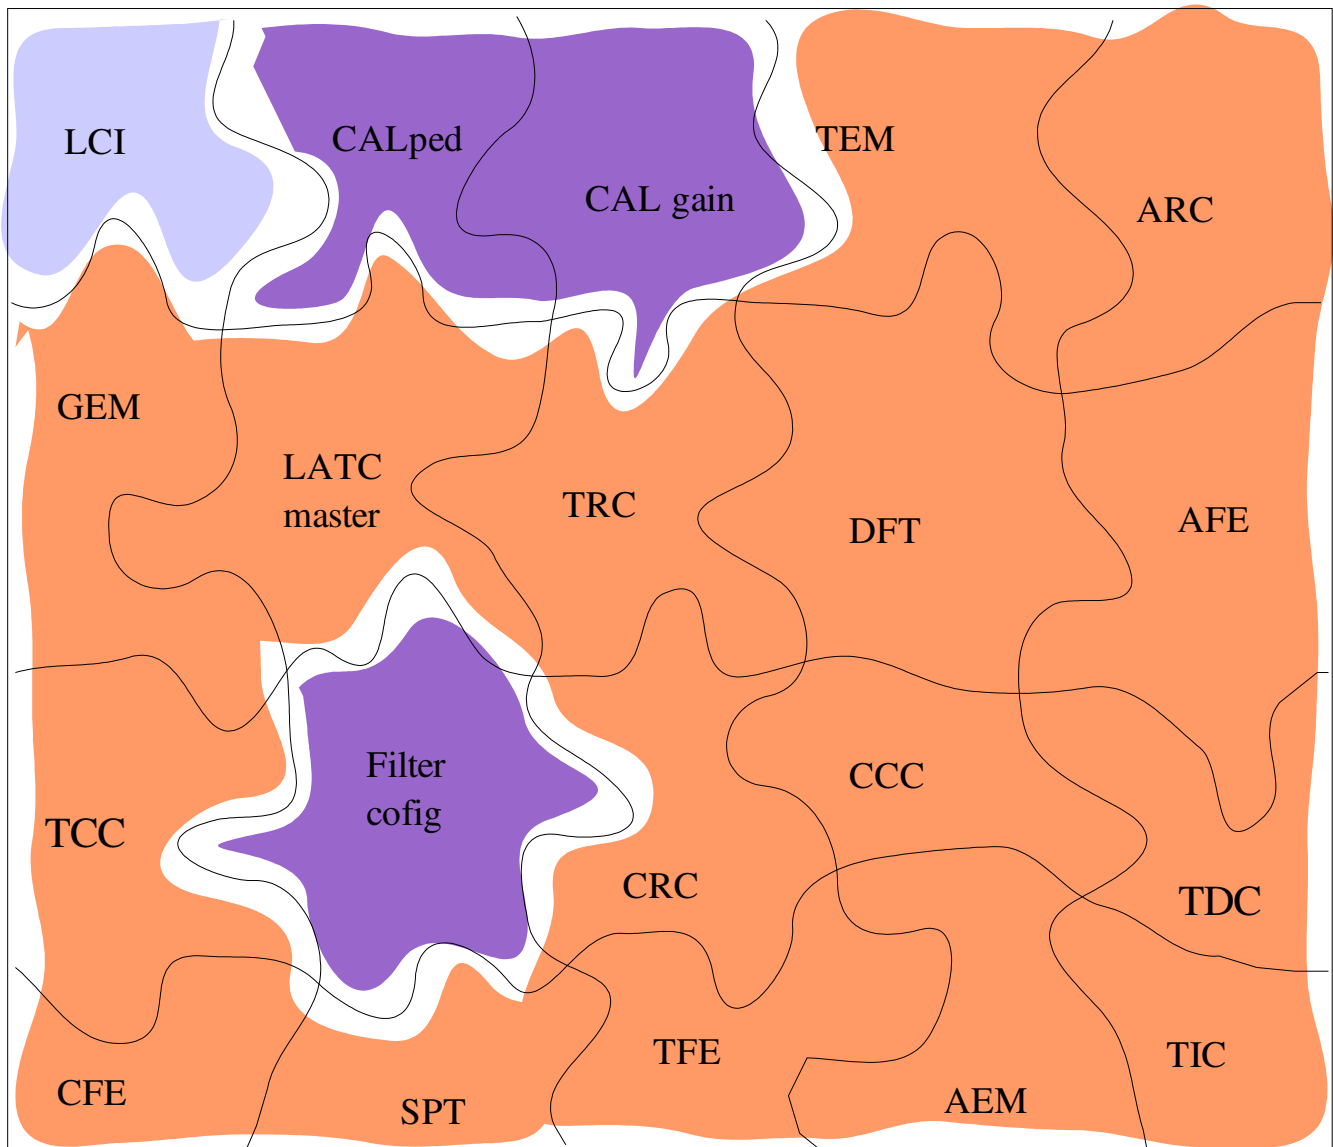

Many binary files are needed to completely determine the configuration (even excluding certain categories, such as binaries for the code). It is a delicate business to ensure that everything that should be specified *is* specified, and only once!

.

No meaning should be attached to the relative locations of pieces above.

Exactly which software configuration files will be needed (peds, gains, filter config,...) TBD.

FSW Files/Delegate overlay

Clearly this is much simpler than the full-blown version of delegates: there are only three colors and no FSW file is colored with more than one color.

But it is even simpler than that: no extra lines are needed to show the parameters. They correspond 1-to-1 with the FSW files.
