# COMMUTATION RELATIONS AND FIELD DEPENDENCE OF VECTOR AND TENSOR CURRENTS* <br> Y. Frishman <br> Stanford Linear Accelerator Center, Stanford, California 

## ABSTRACT

It is shown, directly from proper Lorentz-invariance and a positive Hilbert-space metric, that the vacuum expectation value $\left.<0\left|\left[j_{\mathrm{O}}(\overrightarrow{\mathrm{x}}), \mathrm{j}_{\mathrm{k}}^{\dagger}(\overrightarrow{\mathrm{y}})\right]\right| 0\right\rangle$ cannot vanish unless $\mathrm{j}_{\mu}(\mathrm{x})|0\rangle=\mathrm{j}_{\mu}^{\dagger}(\mathrm{x})|0\rangle \equiv 0$. Neither locality nor Källén-Lehmann type representations are needed. The same is demonstrated for $\langle 0|\left[\mathrm{S}_{\mathrm{k} \mathrm{\ell}}(\overrightarrow{\mathrm{x}}), \mathrm{S}_{\mathrm{om}}^{\dagger}(\overrightarrow{\mathrm{y}})\right]|0\rangle$, for any antisymmetric tensor $S_{\mu \nu}$. The explicit dependence of $j_{\mu}$ and $S_{\mu \nu}$ on the fields with which they interact is an immediate consequence in our approach. Similarly, it is immediate to show that $X(x), X(x)=\partial_{\mu}{ }^{j^{\mu}}(x)$, does not commute with $j_{0}^{\dagger}(y)$ for $y_{0}=x_{0}$, unless $X(x)\left|0>=X^{\dagger}(x)\right| 0>\equiv 0$.

[^0]
## I. INTRODUCTION

Schwinger ${ }^{1}$ demonstrated that the equal time commutator $\left[j_{o}(\vec{x}), j_{k}(\vec{y})\right]$ of the time and space components of a conserved current $j_{\mu}(x)$ cannot vanish. ${ }^{2}$ It was afterwards realized that the above commutator does not vanish also for the case of a non-conserved $\mathrm{j}_{\mu} \cdot{ }^{3-7}$ In those derivations, the assumptions of a local theory and the existence of Källén ${ }^{8}$ - Lehmann ${ }^{9}$ type representations were made by the authors. We show that the non-vanishing of $\langle 0|\left[j_{0} \overrightarrow{(x)}, j_{k}^{\dagger}(\vec{y})\right]|0\rangle$ (we consider polar or axial vector currents, not necessarily hermitian) is independent of the latter assumptions, ${ }^{10}$ provided we do not have $j_{\mu} \mid 0>\equiv 0$ and $j_{\mu}^{\dagger} \mid 0>\equiv 0$ simultaneously. Only proper Lorentz invariance, no massless particles and a positive Hilbert-space metric are assumed. In the same approach, the non-vanishing of the vacuum expectation value $\langle 0|\left[\mathrm{S}_{\mathrm{kl}(\vec{x})}, \mathrm{s}_{\mathrm{om}}^{\dagger}(\overrightarrow{\mathrm{y}})\right]|0\rangle$ for any antisymmetric tensor $\mathrm{S}_{\mu \nu}$, is demonstrated. This fact was pointed out via spectral representations in a local theory, by Boulware and Deser. ${ }^{11}$ The explicit dependence of $j_{\mu}$ and $S_{\mu \nu}$ on the fields with which they interact ${ }^{4,11,12}$ is an immediate consequence in our approach. This is demonstrated for a scalar field gracient coupled to a vector current and for a massive vector field with vector and tensor sources. In the same approach, the non-vanishing of. $<0\left|\left[\mathrm{j}_{0}^{\dagger}(\overrightarrow{\mathrm{x}}), \chi(\overrightarrow{\mathrm{y}})\right]\right| 0>{ }^{11}$ where $X(\mathrm{x})=\partial^{\mu} \mathrm{j}_{\mu}(\mathrm{x})$, is also immediate, provided not both $X$ and $\chi^{\dagger}$ annihilate the vacuum $\mid 0>$.

## II. THE VECTOR CASE

Let us decompose the vector $j_{\mu}(x)$ into

$$
\begin{equation*}
\mathrm{j}_{\mu}(\mathrm{x})=J_{\mu}(\mathrm{x})+\partial_{\mu} \phi(\mathrm{x}) \tag{1}
\end{equation*}
$$

where $\phi(\mathrm{x})$ is defined by ${ }^{13}$

$$
\begin{equation*}
\phi(x)=\square^{-1} \partial^{\mu} j_{\mu}(x) \tag{2}
\end{equation*}
$$

consequently

$$
\begin{equation*}
\partial^{\mu_{J}}{ }_{\mu}(x)=0 \tag{3}
\end{equation*}
$$

It follows that

$$
\begin{equation*}
<0\left|\left[\mathrm{~J}_{\mu}(\mathrm{x}), \mathrm{j}_{\nu}^{\dagger}(\mathrm{y})\right]\right| 0>=\left(\mathrm{g}_{\mu \nu}-\frac{\partial_{\mu} \partial_{\nu}}{\square}\right) \mathrm{F}(\mathrm{x}-\mathrm{y}) \tag{4}
\end{equation*}
$$

where $F(x-y)$ is invariant under proper Lorentz transformations. Thus

$$
\begin{equation*}
<0\left|\left[J_{\mu}(\mathrm{x}), \phi^{\dagger}(\mathrm{y})\right]\right| 0>=0 \tag{5}
\end{equation*}
$$

and hence
$\left.<0\left|\left[\mathrm{j}_{\mu}(\mathrm{x}), \mathrm{j}_{\nu}^{\dagger}(\mathrm{y})\right]\right| 0>=<0\left|\left[J_{\mu}(\mathrm{x}), \mathrm{J}_{\nu}^{\dagger}(\mathrm{y})\right]\right| 0>+<0\left|\left[\partial_{\mu} \phi(\mathrm{x}), \partial_{\nu} \phi^{\dagger}(\mathrm{y})\right]\right| 0\right\rangle$

Suppose that

$$
\begin{equation*}
<0\left|\left[j_{0}(\vec{x}), j_{k}^{\dagger}(\vec{y})\right]\right| 0>=0 \tag{7}
\end{equation*}
$$

then, from (3) and (7), taking the three-divergence of the latter,

$$
\begin{equation*}
<0\left|\left[J_{0} \overrightarrow{(\vec{x})}, \partial^{0} J_{0}^{\dagger}(\vec{y})\right]\right| 0>+<0\left|\left[\phi(\vec{x}), \partial^{0} \partial^{k} \partial_{k} \phi^{\dagger}(\vec{y})\right]\right| 0>=0 \tag{8}
\end{equation*}
$$

Using also

$$
\begin{equation*}
\partial_{\mu} A(x)=i\left[P_{\mu}, A(x)\right] \tag{9}
\end{equation*}
$$

where $P_{\mu}$ are the generators of space-time translations, we obtain

$$
\begin{align*}
& <0\left|J_{0}(\vec{x}) \mathrm{HJ}_{0}^{\dagger}(\vec{y})\right| 0>+<0\left|J_{0}^{\dagger}(\vec{y}) \mathrm{HJ}_{0}(\vec{x})\right| 0>+ \\
& +<0\left|\phi(\overrightarrow{\mathrm{x}}) \mathrm{HP}^{2} \phi{ }^{\dagger}(\vec{y})\right| 0>+<0\left|\phi^{\dagger}(\vec{y}) \mathrm{HP}^{2} \phi(\vec{x})\right| 0>=0 \tag{10}
\end{align*}
$$

from which, using positive definiteness,

$$
\begin{align*}
& J_{0}(x)\left|0>J_{0}^{\dagger}(x)\right| 0>=0  \tag{11a}\\
& \phi(x)\left|0>=\phi^{\dagger}(x)\right| 0>=0 \tag{11b}
\end{align*}
$$

these entail

$$
\begin{equation*}
\mathrm{j}_{\mu}(\mathrm{x})\left|0>=\mathrm{j}_{\mu}^{\dagger}(\mathrm{x})\right| 0>=0 \tag{11c}
\end{equation*}
$$

Thus we have shown that the assumption

$$
<0\left|\left[j_{o}(\vec{x}), j_{k}^{\dagger}(\vec{y})\right]\right| 0>=0
$$

leads to (11c). In a local theory, (11c) implies $\mathrm{j}_{\mu}(\mathrm{x}) \equiv 0$ for a local $\mathrm{j}_{\mu} .14$
Consider now a scalar field $\phi(x)$ gradient coupled to a vector current $\mathrm{j}_{\mu}(\mathrm{x})$. The field canonically conjugate to $\phi^{\dagger}(\mathrm{x})$ is

$$
\begin{equation*}
\phi_{(0)}(x)=\partial_{0} \phi(x)-j_{0}(x) \tag{12}
\end{equation*}
$$

Suppose that

$$
\begin{equation*}
<0\left|\left[\mathrm{j}_{\mathrm{k}}^{\dagger}(\overrightarrow{\mathrm{x}}), \phi_{(0)}(\overrightarrow{\mathrm{y}})\right]\right| 0>=0 \tag{1.3}
\end{equation*}
$$

It then follows ${ }^{15}$

$$
\begin{equation*}
<0\left|\left[j_{0}^{\dagger}(\vec{x}), \partial_{\mathrm{k}} \phi(\overrightarrow{\mathrm{y}})-\mathrm{j}_{\mathrm{k}}(\overrightarrow{\mathrm{y}})\right]\right| 0>=0 \tag{14}
\end{equation*}
$$

and assuming that $<0\left|\left[\mathrm{j}_{\mathrm{O}}^{\dagger}(\overrightarrow{\mathrm{x}}), \phi(\overrightarrow{\mathrm{y}})\right]\right| 0>$ vanishes leads to a contradiction. Thus it is impossible to assume that $\langle 0|\left[j_{k}^{+}(\vec{x}), \phi_{(0)}(\vec{y})\right]|0\rangle$ and
$<0\left|\left[\mathrm{j}_{\mathrm{o}}^{\dagger}(\vec{x}), \phi(\vec{y})\right]\right| 0>$ vanish simultaneously. This was obtained by Boulware and Deser ${ }^{4,11}$ from detailed spectral representation arguments.

Consider now a vector-meson field $A_{\mu}(x)$, coupled to vector $j_{\mu}$ and tensor $S_{\mu \nu}$ sources. The field equations are

$$
\begin{align*}
\partial^{\mu} F_{\mu \nu} & +m_{o}^{2} A_{\nu}=j_{\nu}  \tag{15a}\\
F_{\mu \nu} & =\partial_{\mu} A_{\nu}-\partial_{\nu} A_{\mu}-S_{\mu \nu} \tag{15b}
\end{align*}
$$

where $m_{0}$ is the bare mass of the vector meson. Assuming

$$
\begin{equation*}
<0\left|\left[\mathrm{j}_{\mathrm{k}}^{\dagger} \overrightarrow{(x)}, \mathrm{F}_{\ell 0}(\vec{y})\right]\right| 0>=0 \tag{16a}
\end{equation*}
$$

and

$$
\begin{equation*}
<0\left|\left[j_{0}^{\dagger} \overrightarrow{(x)}, A_{k}(\vec{y})\right]\right| 0>=0 \tag{16b}
\end{equation*}
$$

we immediately obtain that $\mathrm{j}_{\mu}\left|0>\equiv \mathrm{j}_{\mu}^{\dagger}\right| 0>\equiv 0$. This is so because Eq. (16a) implies

$$
\begin{align*}
0 & =<0 \mid\left[j_{k}^{\dagger}(\vec{x}), \partial^{\ell} F_{\ell O}(\vec{y})\right. \\
& \left.-m_{o}^{2}<0\left|\left[j_{k}^{\dagger} \overrightarrow{(x)}, A_{o} \overrightarrow{(y)}\right]\right| 0\right\rangle \tag{17}
\end{align*}
$$

and (16b) implies that $<0\left|\left[j_{k}^{\dagger}(\vec{x}), A_{o}(\vec{y})\right]\right| 0>=0$ (by arguments similar to those in Footnote 15).

In case that only (16b) holds we get

$$
\begin{equation*}
<0\left|\left[\mathrm{j}_{\mathrm{k}}^{+}(\overrightarrow{\mathrm{x}}), \partial^{\ell} \mathrm{F}_{\ell 0}(\overrightarrow{\mathrm{y}})\right]\right| 0>=<0\left|\left[\mathrm{j}_{\mathrm{k}}^{\dagger}(\overrightarrow{\mathrm{x}}), \mathrm{j}_{\mathrm{O}}(\overrightarrow{\mathrm{y}})\right]\right| 0>\neq 0 \tag{18}
\end{equation*}
$$

which may serve to determine the form of the dependence of $j_{k}(\vec{x})$ on $A_{\ell}(\vec{y}) .{ }^{11}$

Another application is to theories where a relation of the type $\quad \partial{ }_{j_{\mu}}(x)=X(x)$ holds. ${ }^{11}$ Using Eq. (6) we get

$$
\begin{align*}
& <0\left|\left[X(x), j_{0}^{\dagger}(y)\right]\right| 0>=<0\left|\left[\square \phi(x), \partial_{0} \phi^{\dagger}(y)\right]\right| 0> \\
& \quad=-i\left\{<0\left|\phi(x) P^{2} H \phi^{\dagger}(y)\right| 0>+<0\left|\phi^{\dagger}(y) \mathrm{P}^{2} \mathrm{H} \phi(x)\right| \phi_{\phi}\right\} \tag{19}
\end{align*}
$$

Thus

$$
\begin{equation*}
<0\left|\left[X(\overrightarrow{\mathrm{x}}), \mathrm{j}_{\mathrm{o}}^{+} \overrightarrow{(\mathrm{y})}\right]\right| 0>=0 \tag{20}
\end{equation*}
$$

implies

$$
\begin{equation*}
\chi(x)\left|0>=X^{\dagger}(x)\right| 0>=0 \tag{21}
\end{equation*}
$$

In a local theory this also implies $\chi(x) \equiv 0 .{ }^{14}$
III. THE TENSOR CASE

Consider the antisymmetric tensor $\mathrm{S}_{\mu \nu}=-\mathrm{S}_{\nu \mu}$. Let us define

$$
\begin{equation*}
V_{\nu}(x)=\square^{-1} \partial^{\mu} S_{\mu \nu}(x) \tag{22}
\end{equation*}
$$

Then

$$
\begin{equation*}
\mathrm{S}_{\mu \nu}(\mathrm{x})=\widetilde{\mathrm{S}}_{\mu \nu}(\mathrm{x})+\left(\partial_{\mu} \mathrm{V}_{\nu}(\mathrm{x})-\partial_{\nu} \mathrm{V}_{\mu}(\mathrm{x})\right) \tag{23}
\end{equation*}
$$

where

$$
\begin{equation*}
\widetilde{S}_{\mu \nu}=-\widetilde{\mathbf{S}}_{\nu \mu} \tag{24a}
\end{equation*}
$$

and

$$
\begin{equation*}
\partial^{\mu} \mathrm{V}_{\mu}(\mathrm{x})=0 \quad \partial^{\mu} \widetilde{\mathrm{S}}_{\mu, \nu}(x)=0 \tag{24b}
\end{equation*}
$$

Now,

$$
\begin{align*}
& \sum_{\mathrm{m}}^{\sum_{\mathrm{m}}}<0\left|\left[\mathrm{~S}_{\mathrm{km}}(\mathrm{x}), \mathrm{S}_{\mathrm{om}}^{\dagger}(\mathrm{y})\right]\right| 0>= \\
& =\sum_{\mathrm{m}}<0\left|\left[\widetilde{\mathrm{~S}}_{\mathrm{km}}(\mathrm{x}), \widetilde{\mathrm{S}}_{\mathrm{om}}^{\dagger}(\mathrm{y})\right]\right| 0>-<0\left|\left[\partial_{\mathrm{k}} \mathrm{~V}_{\nu}(\mathrm{x})-\partial_{\nu} \mathrm{V}_{\mathrm{k}}(\mathrm{x}), \partial_{\mathrm{o}} \mathrm{~V}^{\nu} \dagger(\mathrm{y})-\partial^{\nu} \mathrm{V}_{\mathrm{o}}^{\dagger}(\mathrm{y})\right]\right| 0> \\
& -<0\left|\left[\widetilde{S}_{k \nu}(x), \partial_{o} V^{\nu} \dagger(y)-\partial^{\nu} V_{o}^{\dagger}(y)\right]\right| 0>-<0\left|\left[\partial_{k} V_{\nu}(x)-\partial_{\nu} V_{k}(x), \tilde{S}_{o}^{\dagger \nu}(y)\right]\right| 0> \\
& =\sum_{\mathrm{m}}<0\left|\left[\widetilde{\mathrm{~S}}_{\mathrm{km}}(\mathrm{x}), \widetilde{\mathrm{S}}_{\mathrm{om}}^{\dagger}(\mathrm{y})\right]\right| 0> \\
& \left.\left.-<0\left|\left[\partial_{\mathrm{k}} \mathrm{~V}_{\nu}(\mathrm{x}), \partial_{\mathrm{o}} \mathrm{~V}^{\nu \dagger}(\mathrm{y})\right]\right| 0\right\rangle-<0\left|\left[\partial_{\nu} \mathrm{V}_{\mathrm{k}}(\mathrm{x}), \partial^{\nu} \mathrm{V}_{\mathrm{o}}^{\dagger}(\mathrm{y})\right]\right| 0\right\rangle \tag{25}
\end{align*}
$$

where we have used $<0\left|\left[\widetilde{\mathrm{~S}}_{\mu \nu}(\mathrm{x}), \mathrm{V}^{\nu} \dagger_{(\mathrm{y})}\right]\right| 0>=0 .{ }^{16}$ From

$$
\begin{equation*}
<0\left|\left[V_{\mu}(\mathrm{x}), \mathrm{V}_{\nu}^{\dagger}(\mathrm{y})\right]\right| 0>=\left(\mathrm{g}_{\mu \nu}-\frac{\partial_{\mu} \partial_{\nu}}{\square}\right) \mathrm{G}(\mathrm{x}-\mathrm{y}) \tag{26}
\end{equation*}
$$

we obtain

$$
\begin{equation*}
<0\left|\left[\partial_{\mathrm{k}} \mathrm{~V}_{\nu}(\mathrm{x}), \partial_{\mathrm{o}} \mathrm{~V}^{\nu} \dagger_{(\mathrm{y})}\right]\right| 0>=-3<0\left|\left[\partial_{\nu} \mathrm{V}_{\mathrm{k}}(\mathrm{x}), \partial^{\nu} \mathrm{V}_{\mathrm{o}}^{\dagger}(\mathrm{y})\right]\right| 0> \tag{27}
\end{equation*}
$$

and thus, combined with (25),

$$
\begin{align*}
& \sum_{m}<0\left|\left[2^{k} S_{k m}(x), S_{o m}^{\dagger}(y)\right]\right| 0>= \\
& =\sum_{m}<0\left|\left[\widetilde{S}_{o m}(x), \partial^{0} \widetilde{S}_{o m}^{+}(y)\right]\right| 0>-2<0\left|\left[\square V_{o}(x), \partial^{o} V_{o}^{\dagger}(y)\right]\right| 0>. \\
& =\mathrm{i}\left\{\sum_{m}\left[<0\left|\widetilde{\mathrm{~S}}_{\mathrm{om}}(\mathrm{x}) \mathrm{H} \widetilde{\mathrm{~S}}_{\mathrm{om}}^{\dagger}(\mathrm{y})\right| 0>+<0\left|\tilde{\mathrm{~S}}_{\mathrm{om}}^{\dagger}(\mathrm{y}) \mathrm{H} \widetilde{\mathrm{~S}}_{\mathrm{om}}(\mathrm{x})\right| 0>\right]+\right. \\
& \left.+2\left[<0\left|\mathrm{~V}_{\mathrm{o}}(\mathrm{x}) \mathrm{P}^{2} \mathrm{H} \mathrm{~V}_{\mathrm{o}}^{\dagger}(\mathrm{y})\right| 0>+<0\left|\mathrm{~V}_{0}^{\dagger}(\mathrm{y}) \mathrm{P}^{2} \mathrm{H} \mathrm{~V}_{\mathrm{o}}(\mathrm{x})\right| 0>\right]\right\} \tag{28}
\end{align*}
$$

Thus

$$
\begin{equation*}
<0\left|\left[\mathrm{~S}_{\mathrm{km}}(\overrightarrow{\mathrm{x}}), \mathrm{S}_{\mathrm{Ol}}^{\dagger} \overrightarrow{(\mathrm{y})}\right]\right| 0>=0 \tag{29}
\end{equation*}
$$

implies

$$
\begin{equation*}
\mathbf{S}_{\mu \nu}\left|0>\equiv \mathbf{S}_{\mu \nu}^{\dagger}\right| 0>\equiv 0 \tag{30}
\end{equation*}
$$

by arguments similar to those following Eq. (10). Again, locality implies also

$$
\mathrm{S}_{\mu \nu} \equiv 0 . .^{14}
$$

Returning now to the vector meson field $A_{\mu}$ of the former section, we can immediately show that it is impossible to have

$$
\begin{equation*}
<0\left|\left[S_{o l}^{\dagger}(\vec{x}), A_{m}(\vec{y})\right]\right| 0>=0 \tag{31a}
\end{equation*}
$$

and

$$
\begin{equation*}
<0 \mid\left[\mathrm { S } _ { \mathrm { ml } } ^ { \dagger } \left(\overrightarrow{\mathrm{x})}, \mathrm{F}_{\mathrm{ol}}(\overrightarrow{\mathrm{y})}] \mid 0>=0\right.\right. \tag{31b}
\end{equation*}
$$

simultaneously. For if it were so, then we would get

$$
\begin{equation*}
<0\left|\left[S_{m \ell}^{\dagger}(\vec{x}), S_{O \ell}(\vec{y})\right]\right| 0>=<0\left|\left[S_{m \ell}^{\dagger} \overrightarrow{(x)}, \partial_{0} A_{\ell}(\vec{y})-\partial_{\ell} A_{0}(\vec{y})\right]\right| 0> \tag{32}
\end{equation*}
$$

However, since

$$
\begin{equation*}
\left.<0\left|\left[\mathrm{~S}_{\mu \nu}^{\dagger}(\mathrm{x}), \mathrm{A}_{\lambda}(\mathrm{y})\right]\right| 0\right\rangle=\left(\mathrm{g}_{\mu \lambda} \partial_{\nu}-\mathrm{g}_{\nu \lambda} \partial_{\mu}\right) \mathrm{R}_{1}(\mathrm{x}-\mathrm{y})+\epsilon_{\mu \nu \lambda \sigma} \sigma^{\sigma} \mathrm{R}_{2}(\mathrm{x}-\mathrm{y}) \tag{33}
\end{equation*}
$$

we get from (31a),

$$
\begin{equation*}
\left[\partial_{0} R_{1}(x)\right]_{x_{0}=0}=0 \quad \partial_{r} R_{2}(\vec{x})=0 \tag{34}
\end{equation*}
$$

Eqs. (33) and (34) together imply that the right hand side of (32) is zero, thus obtaining a contradiction, unless (30) holds.

## ACKNOWLEDGEMENTS

It is a pleasure to thank Professor A. Katz for fruitful discussions and comments. Comments by Professors S. D. Drell, A. M. Jaffe and B. Schröer are gratefully acknowledged. The author would also like to thank the United States Educational Foundation in Israel for a Fulbright travel grant.
