66. A quadrupole magnet in the 20 GeV spectrometer had been slightly askew during the 6 degree measurements of experiment C. A correction of  $\theta$  to account for this skewing

changed the scattering angle from 6.000 to 5.988 degrees, but the uncertainty in this procedure was too severe to permit use of the 6 degree elastic e-p cross sections in the calculation of the normalization factor. E. Bloom and J.S. Poucher, private communication.

79. For example the behavior of  $R_n$  at the position of the elastic peak is expected from local duality arguments to be  $R_n \rightarrow (4M^2/Q^2) (G_E^2/G_M^2) = 0$  if  $G_E^2(Q^2) = 0$ . See refs. 23 and 74. Similar arguments could be made for  $R_n$  at values of  $W$  close to the resonance region.
