66. A quadrupole magnet in the 20 GeV spectrometer had been slightly askew during the 6 degree measurements of experiment C. A correction of \( \theta \) to account for this skewing
changed the scattering angle from 6.000 to 5.988 degrees, but the uncertainty in this procedure was too severe to permit use of the 6 degree elastic e-p cross sections in the calculation of the normalization factor. E. Bloom and J.S. Poucher, private communication.

(1973).
79. For example the behavior of $R_n$ at the position of the
elastic peak is expected from local duality arguments to
be $R_n + (4M^2/Q^2)(G_E^2/G_M^2) = 0$ if $G_E^2(Q^2) = 0$. See refs. 23
and 74. Similar arguments could be made for $R_n$ at values
of $W$ close to the resonance region.
