# *Water as a proton decay detector*

## •Source H<sub>2</sub>O

- 2/10 free proton → no nuclear effect, accurate&high detection efficiency  
→ no Fermi motion, good momentum valance
- 0.54Megaton(Hyper-K) →  $\sim 2 \times 10^{35}$  protons

## •Good detector performance

- Vertex resolution: 30 cm (1-ring)  
:  $\sim 20$  cm( $p \rightarrow e^+\pi^0$ )
- Trigger threshold: 5 MeV electrons  
→ trigger  $\varepsilon=100\%$  for most of nucleon decay modes
- Energy resolution: 3~4% for e,  $\mu$
- Particle ID : 99% 1-ring  $\mu$ , e  
:  $\sim 95\%$   $p \rightarrow e^+\pi^0$ ,  $p \rightarrow \mu^+\pi^0$

**These performance is achieved in Super-K-I, 40% photo-coverage.**

**Question: can we reduce photo-coverage? Keeping the excellent performance?**

# Large water Cherenkov detectors

**Super-K 22kton**

Simulation was done.

SK-I: 40% coverage

SK-II: 19% coverage

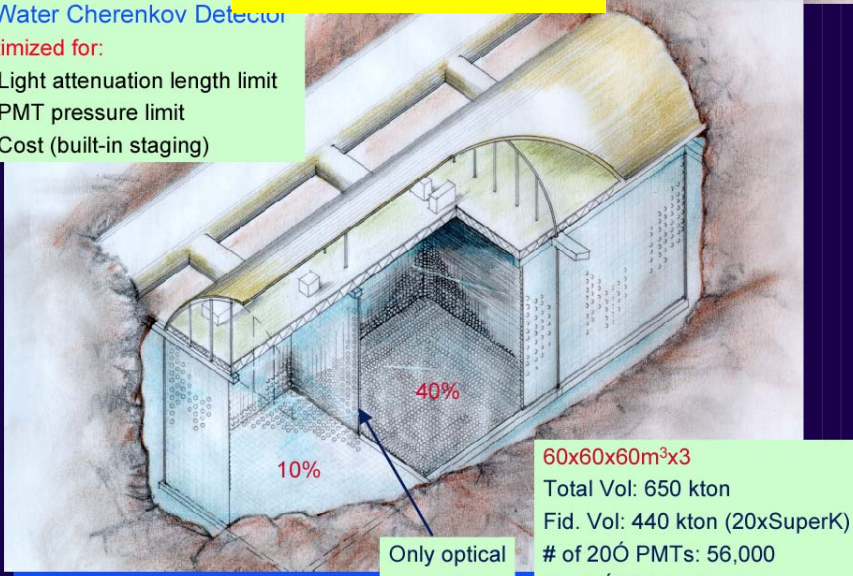

**Hyper-K 540kton**

**UNO 440kton**

A Water Cherenkov Detector optimized for:

- ¥ Light attenuation length limit
- ¥ PMT pressure limit
- ¥ Cost (built-in staging)

60x60x60m<sup>3</sup>x3  
 Total Vol: 650 kton  
 Fid. Vol: 440 kton (20xSuperK)  
 # of 20" PMTs: 56,000  
 # of 8" PMTs: 14,900

# $p \rightarrow e^+ \pi^0$ @Super-K

## $p \rightarrow e^+ \pi^0$ MC

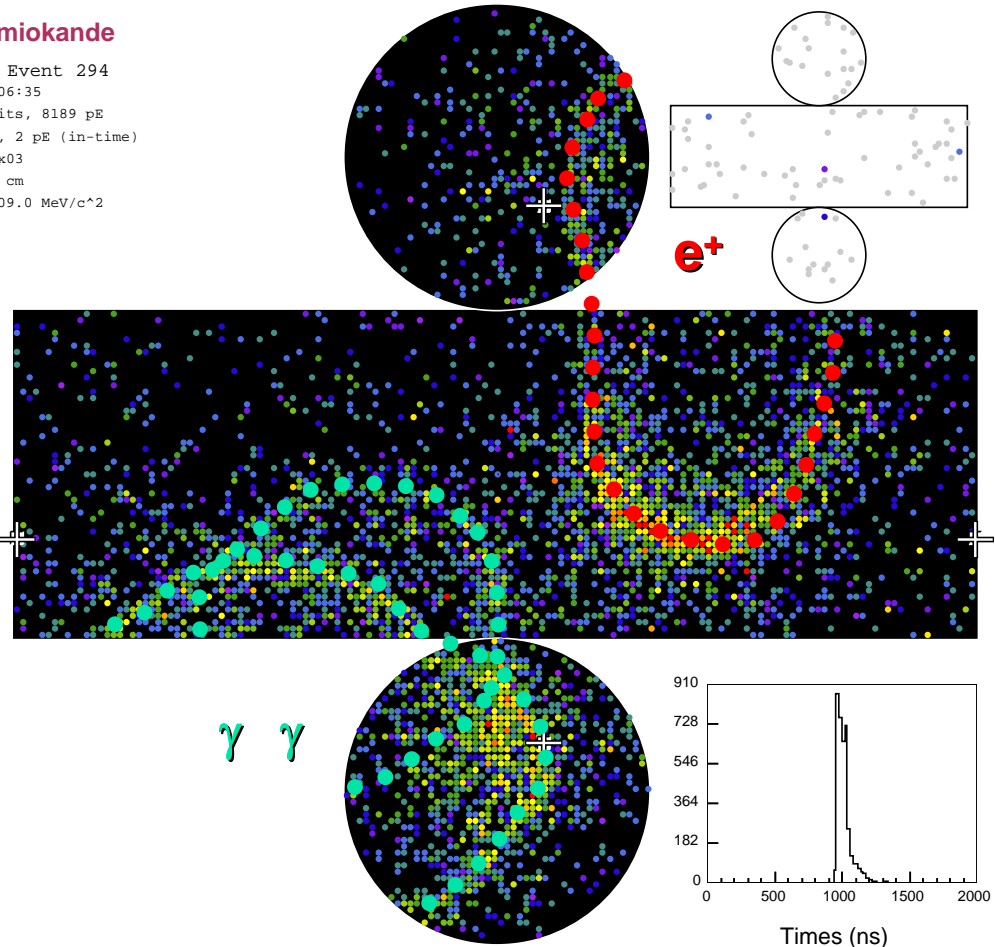

### Super-Kamiokande

Run 999999 Event 294

# $p \rightarrow e^+ \pi^0$ @ Super-K

## $p \rightarrow e^+ \pi^0$ MC

### Criteria for $p \rightarrow e^+ \pi^0$

- 2 or 3 Cherenkov rings
- All rings are showering
- $85 < M_{\pi^0} < 185 \text{ MeV}/c^2$   
(3-ring)
- No decay electron
- $800 < M_{\text{proton}} < 1050 \text{ MeV}/c^2$   
 $P_{\text{total}} < 250 \text{ MeV}/c$

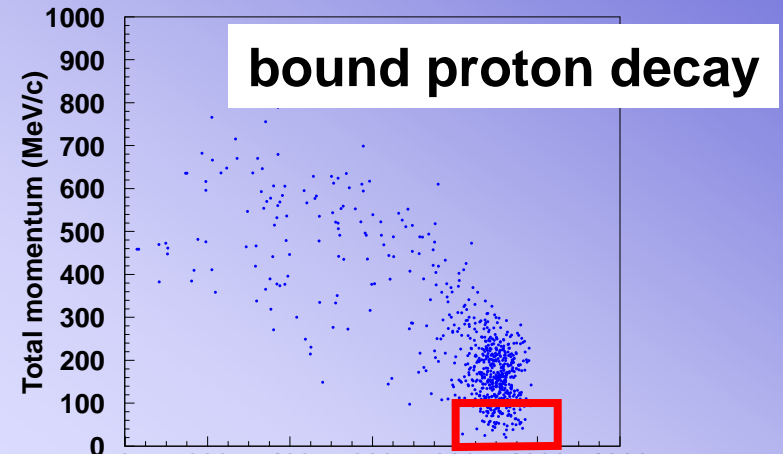

$\epsilon = 40 \% \text{ in SK-I}$

# Tight momentum cut for $p \rightarrow e^+ \pi^0$

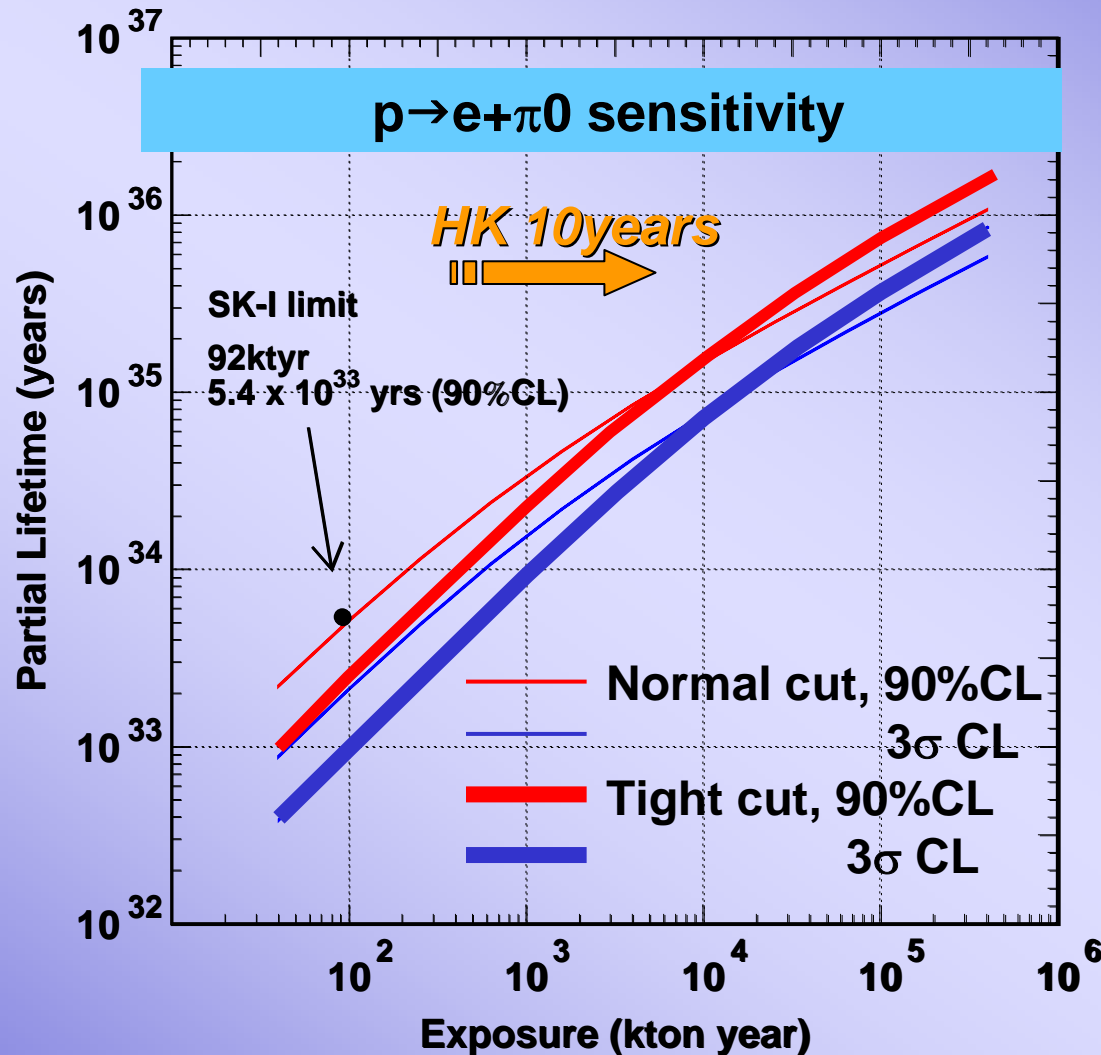

- $P_{\text{tot}} < 250 \text{ MeV/c}$ ,  
BG 2.2ev/Mtyr, eff=44%
- ↓
- $P_{\text{tot}} < 100 \text{ MeV/c}$ ,  
BG 0.15ev/Mtyr, eff=17.4%

Main target is free proton decays for the tight cut.

# Lifetime sensitivity for $p \rightarrow e^+ \pi^0$

Hyper-K 10yrs  $\rightarrow$   $\sim 10^{35}$  years @ 90%CL  
 $\sim 4 \times 10^{34}$  years @ 3 $\sigma$ CL

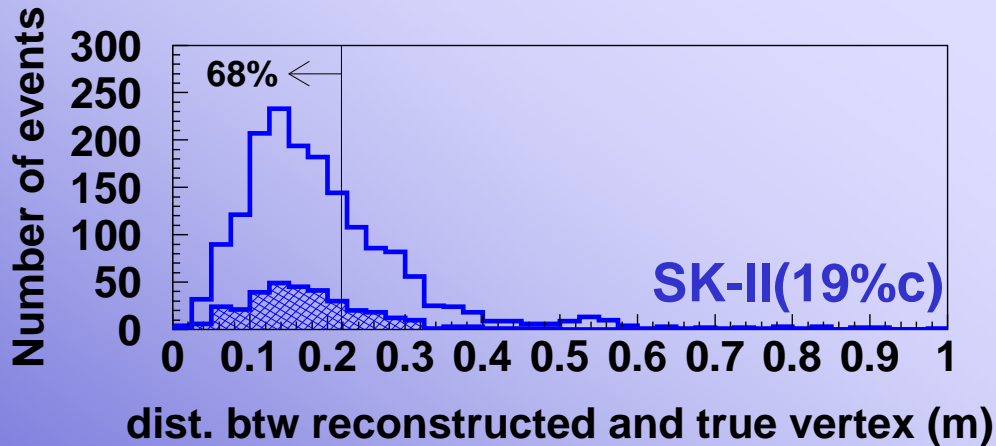

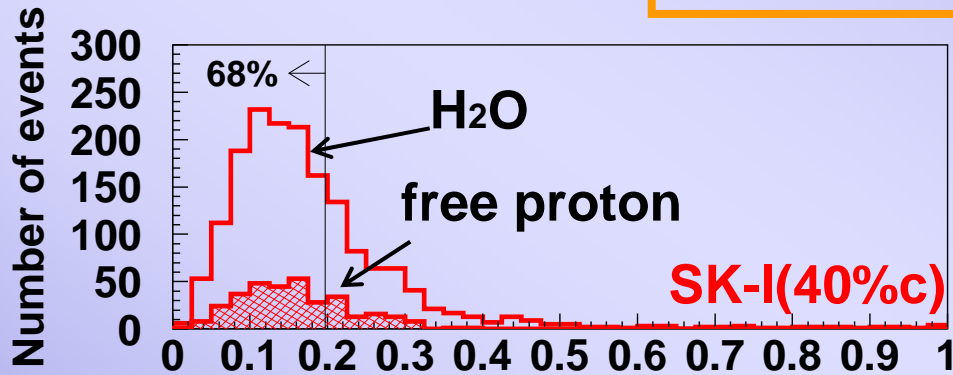

# ***Reduce photo-sensor cost?***

- sensor cost is a significant part of total cost.
  - in case of Hyper-K
$$1000\$(1/3 \times SK) \times 200,000(40\% \text{ coverage}) = 200M\$$$
- important to understand minimum requirement of photo-coverage from each physics topics ( $p \rightarrow e + \pi^0$  in my talk)
- SK-II (19% coverage  $\leftrightarrow$  SK-I 40%) is a good opportunity to investigate physics sensitivity with reduced photo-coverage
  - well tuned SK-II detector simulation
  - fitters (vertex, ring#, particle ID, momentum...) are also well tuned and calibrated.
  - reliable study is possible.

# (1) vertex fitter and (2) ring fitter

## $p \rightarrow e + \pi^0$ Monte Carlo

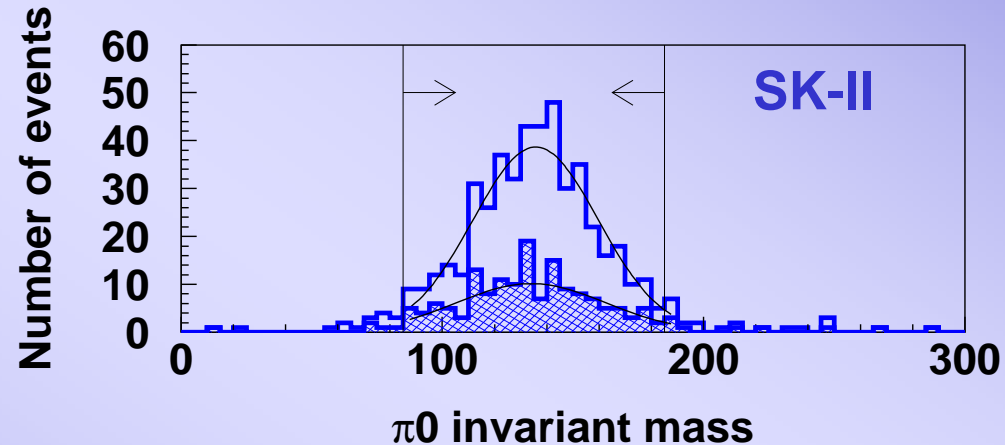

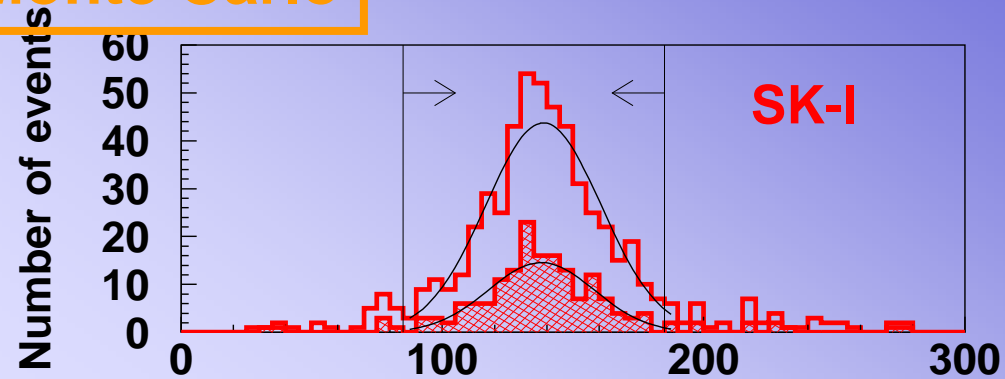

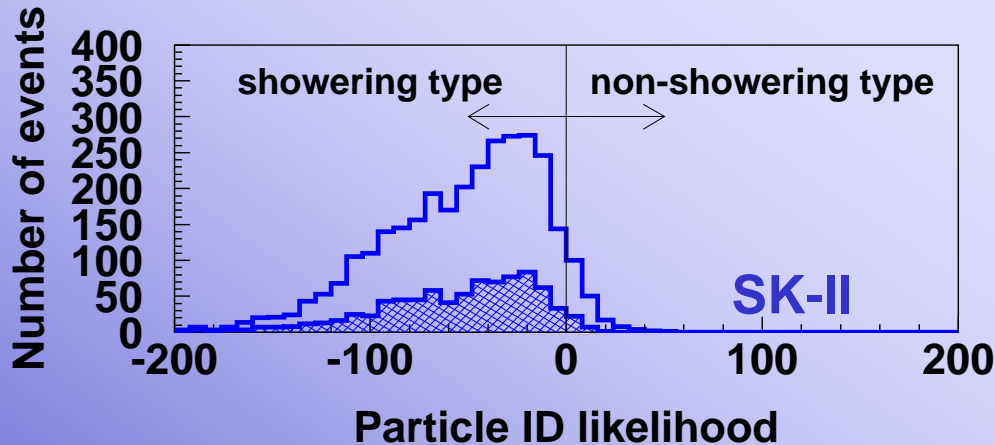

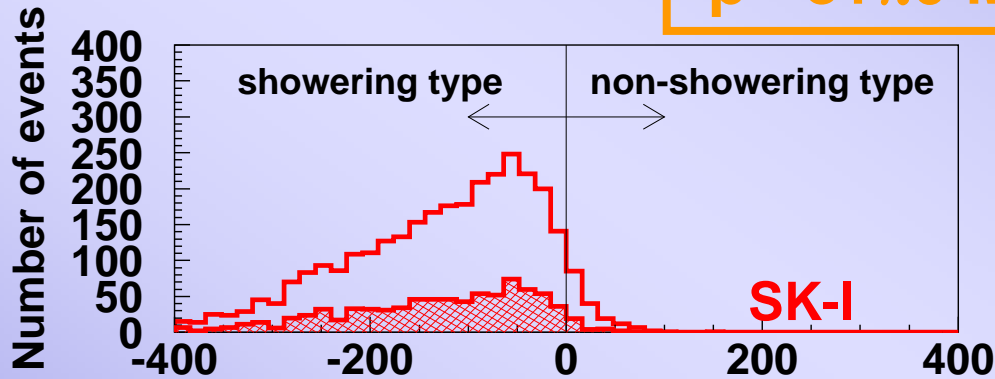

19.7cm(68%)  $\rightarrow$  21.8cm(68%)  
Almost same performance

Efficiency(74% for 2-3rings) doesn't change  
Fraction of 3ring slightly decrease

# (3) Particle ID and (4) $\pi^0$ mass

## $p \rightarrow e + \pi^0$ Monte Carlo

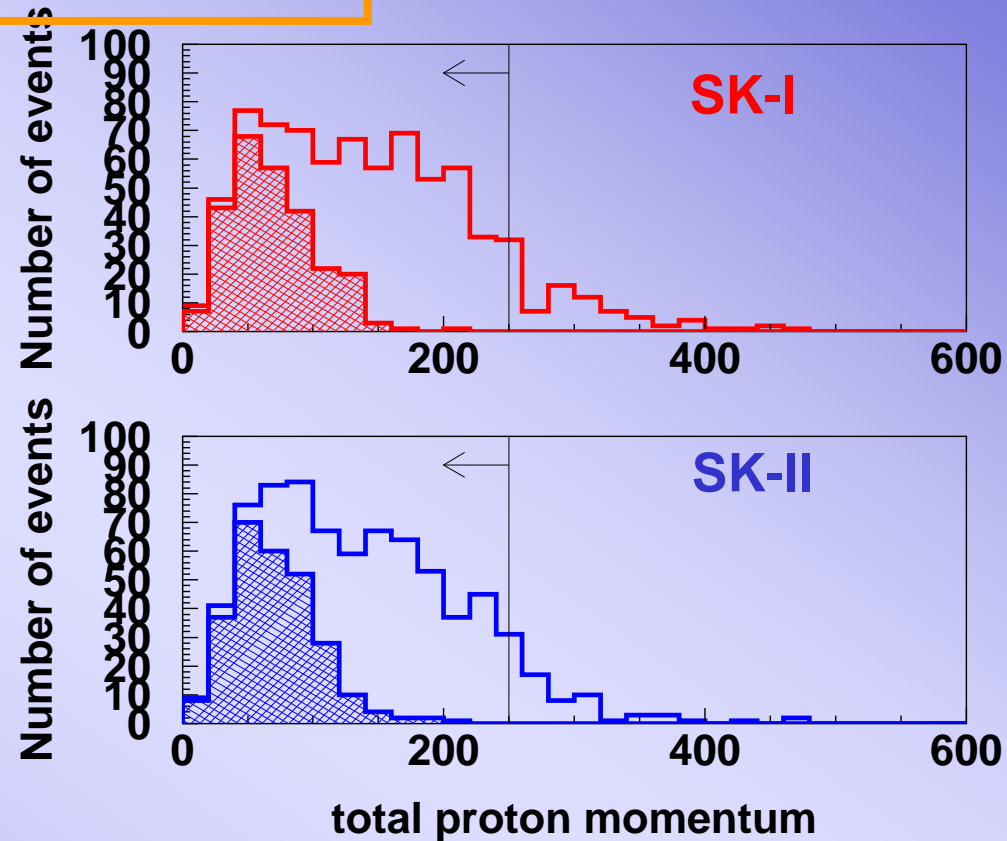

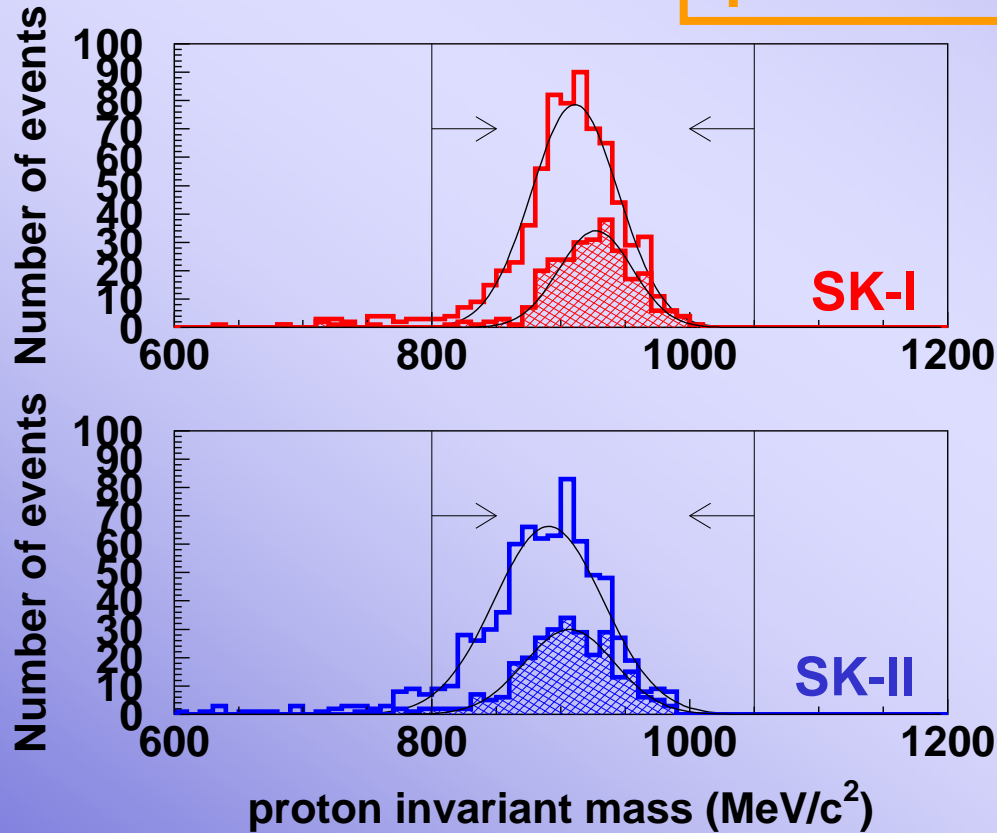

**PID performance; 94-95%  
96% for free proton decay**

**$\pi^0$  mass resolution;**  
 22.1MeV  $\rightarrow$  24.0MeV  
 free proton 20.2MeV  $\rightarrow$  28.5MeV

# (5) Proton mass and (6) proton momentum

April 2005 @ NNN05

$p \rightarrow e + \pi^0$  Monte Carlo

proton mass resolution;  
33.8 MeV  $\rightarrow$  42.3  
free proton 28.5 MeV  $\rightarrow$  35.2

proton mom. resolution;  
177 MeV (68%)  $\rightarrow$  171  
free proton 81 MeV (68%)  $\rightarrow$  83

# Efficiency in each step

$p \rightarrow e + \pi^0$  Monte Carlo

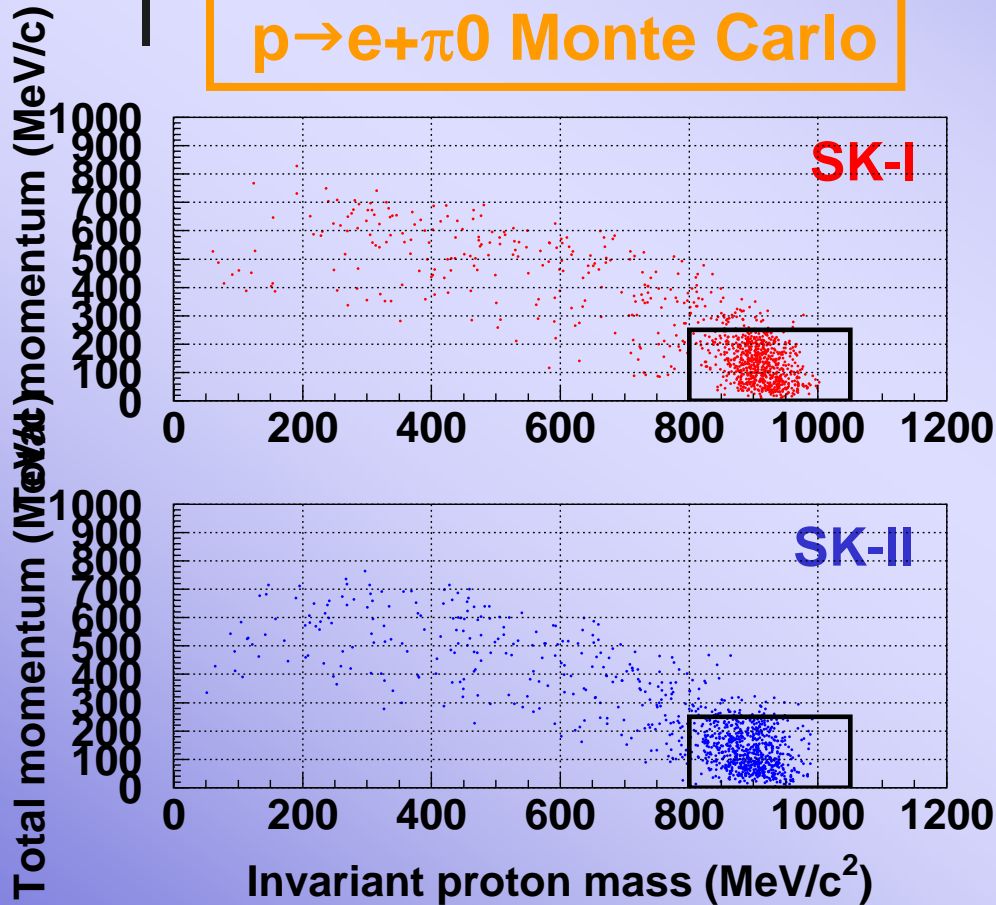

Detection eff. =  
 (40.1 $\pm$ 1.5)% -- SK-I  
 (41.1 $\pm$ 1.5)% -- SK-II

Same efficiency within 1% level

Slightly worse resolution of  $\pi^0$  and proton mass

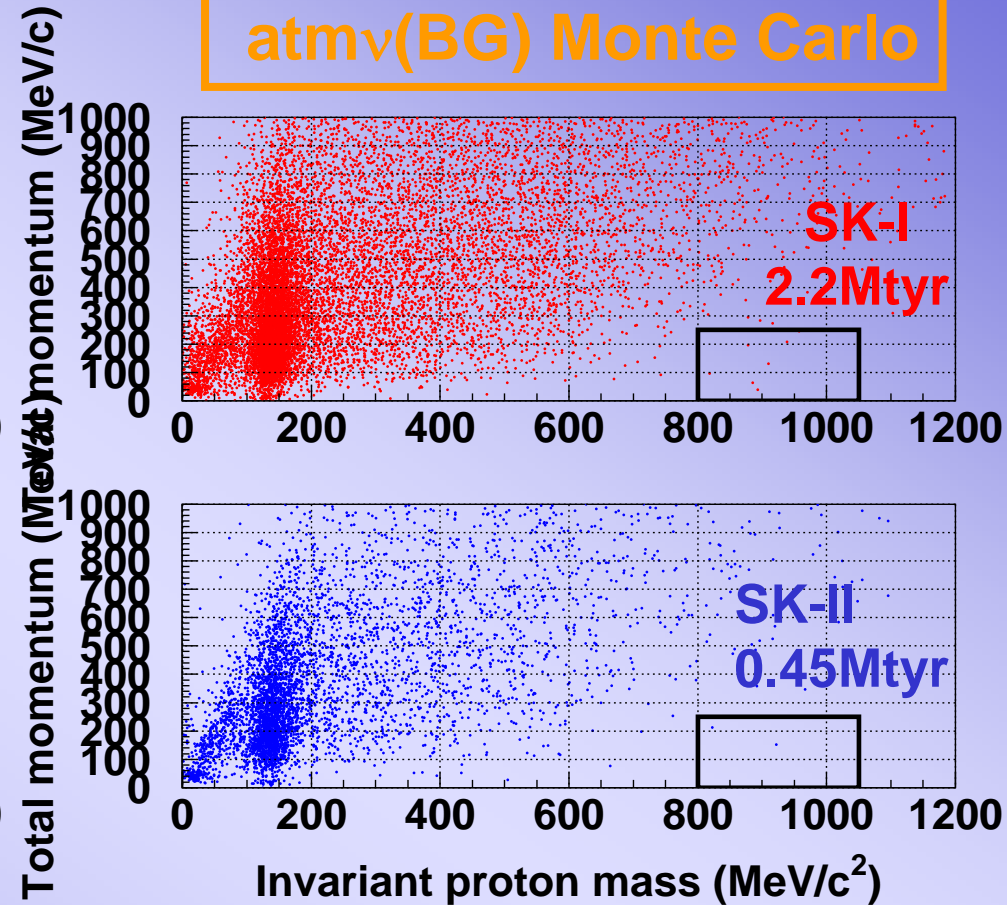

# Proton mass vs momentum

$p \rightarrow e + \pi^0$  Monte Carlo

$(40.1 \pm 1.5)\% \rightarrow (41.1 \pm 1.5)\%$

atm $\nu$ (BG) Monte Carlo

$8\text{ev}/2.2\text{Mtonyr} \rightarrow 2\text{ev}/0.45\text{Mtonyr}$   
 $\sim 10 \pm 7\text{ev}/2.2\text{Mtyr}$   
 Same BG level within 70%

# Conclusion

- Water Cherenkov detector is an excellent detector for  $p \rightarrow e^+\pi^0$  searches.
- detailed comparison btw 40% and 20% coverage
  - same  $p \rightarrow e^+\pi^0$  efficiency even with 20% coverage
  - slightly worse mass resolution
  - 10% coverage maybe acceptable
  - need further studies on other decay modes, like  $p \rightarrow \nu + K^+$ ,  $e^+ + K^0$ , ...

$\sim 0.15$  events/Mton · yr

# Analysis for discovery of $p \rightarrow e^+ \pi^0$

Tight momentum cut

⇒ target is mainly free protons

efficiency=17.4%, 0.15BG/Mtyr

No Fermi momentum  
No binding energy  
No nuclear effect

Small systematic uncertainty of efficiency  
High detection efficiency  
Perfectly known proton mass and momentum

# Lifetime prediction

- Dimension=6 (2 fermion – 2 fermion)

$$\Gamma = \frac{g^4 m^5 p}{M_X^4} \quad : \tau(p \rightarrow e^+ \pi^0) = 10^{35?} \text{ years}$$

- Dimension=5 (2 fermion - 2 sfermion)

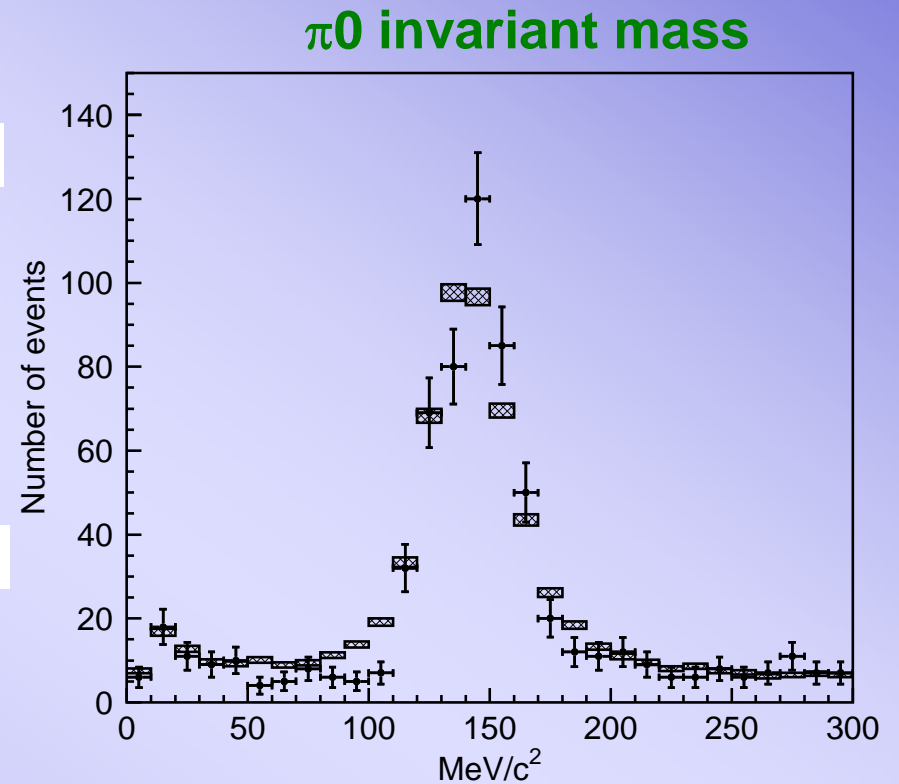

$$\Gamma = \frac{h^4 m^5 p}{M_{Hc}^2 M_X^2} \quad : \tau(p \rightarrow \nu K^+) = 10^{29 \sim 39?} \text{ years}$$
