

Experimental Overview on Higgs coupling measurements

- 1.introduction
- 2.Measurement scheme
- 3.Examples of Possible Deviation from SM in models
- 4.What kind of issues to be studied, modified, etc..

Satoru Yamashita
(ICEPP, Univ. of Tokyo)

Higgs Sector is unknown

Electroweak fit at LEP/SLC/Tevatron tells
At least one should exist below 300 GeV
which couples to Z and W

Almost NOTHING is known

- NOTHING is known for **Yukawa-coupling**
- NOTHING is known for **self-coupling**

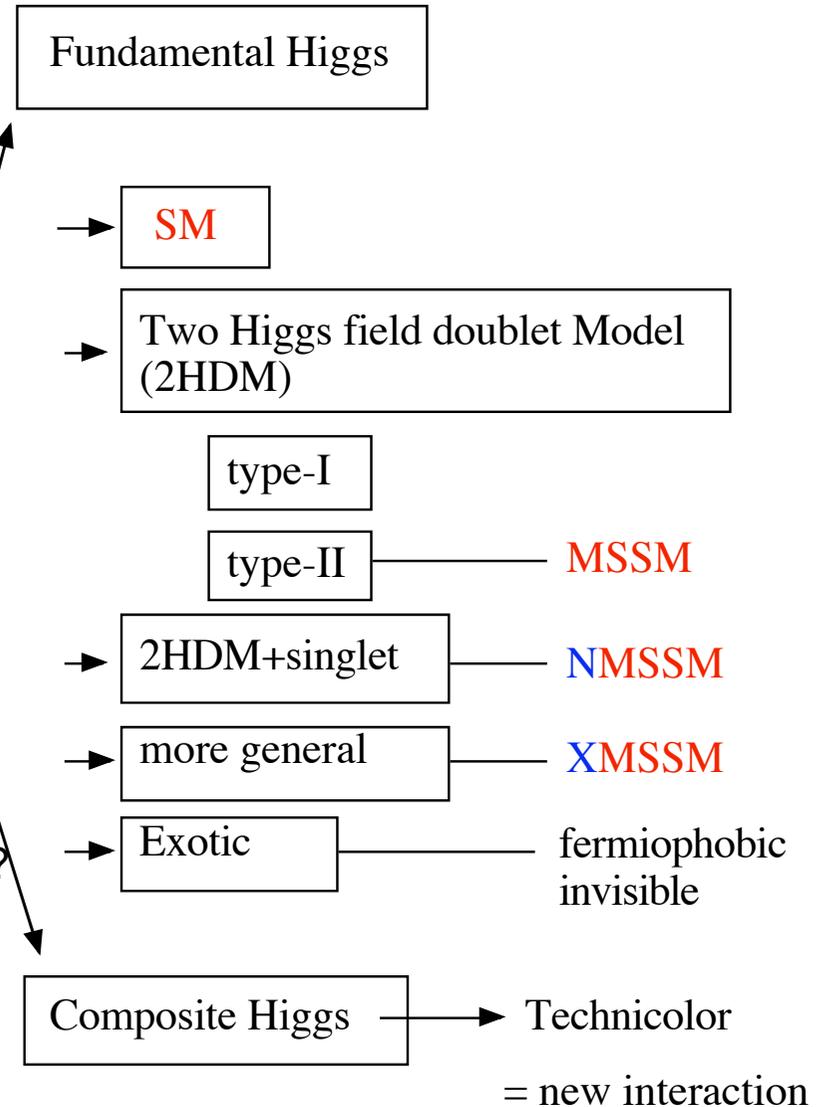

- Single Higgs? Two Higgs field doublets?
- Additional singlet? Triplet?

- SUSY? Extra-dimension?
- **Composite?**
- Type-I? Type-II?

- Why top is so heavy? Special for 3rd generation?

- **CP-violation** in Higgs sector?

- More exotics?

Higgs at ILC

1. The Most Fundamental Issues to be clarified

A. Gauge coupling

B. Yukawa-coupling

- Up-type vs Down-type - top vs bottom (charm vs bottom)
- Quark vs lepton - bottom vs tau
- 2nd generation vs 3rd generation - mu vs tau, charm vs top

C. Self-coupling

2. Reconstruct the Higgs sector

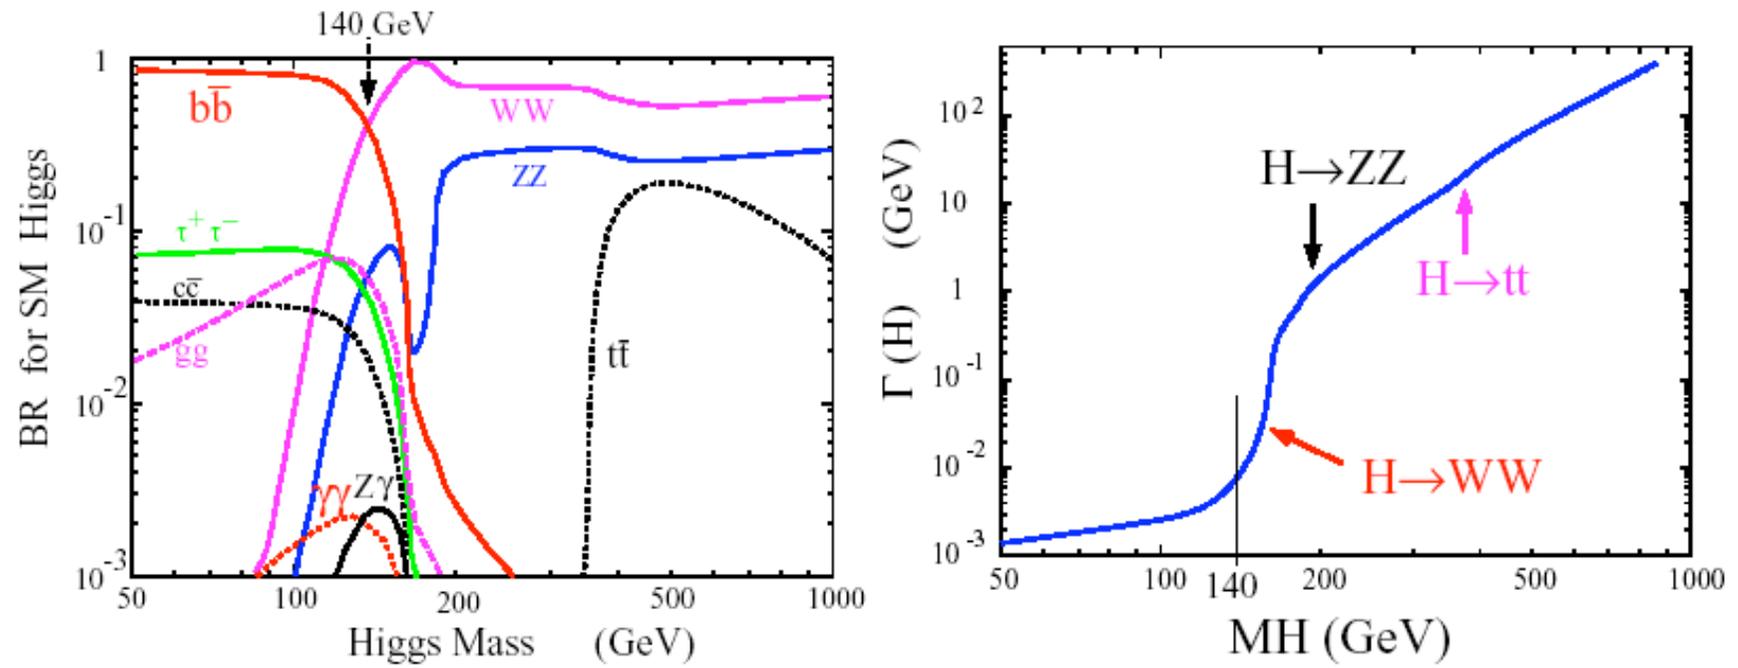

3. Discriminate among various models, Translate the deviation from SM into quantity in New physics models

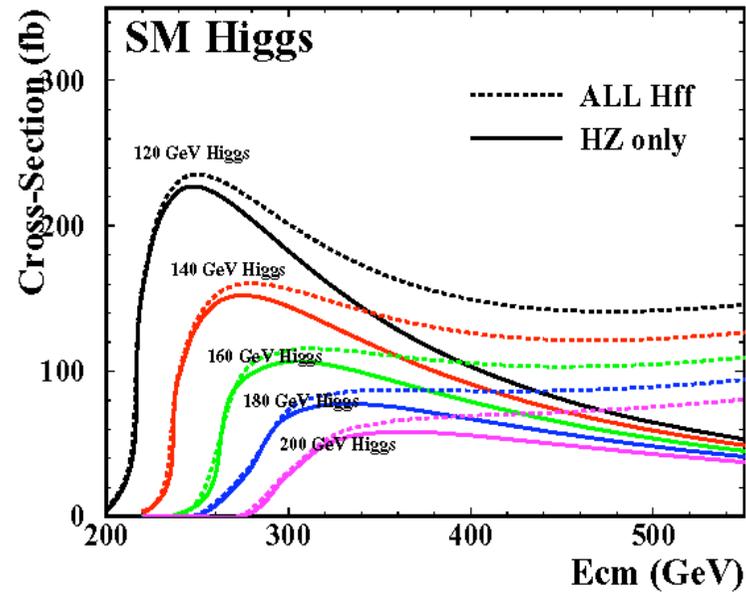

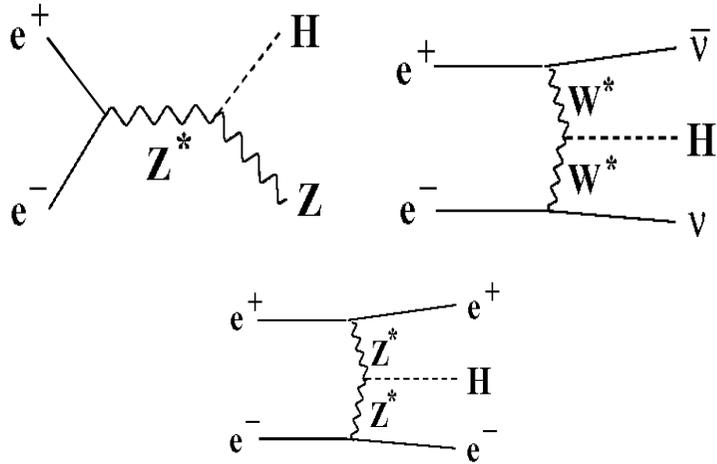

Key analyses techniques are:

1. Jet finding / jet clustering
2. Jet energy calculation
3. b, c, top, tau tagging
4. W, Z tagging
5. Kinematic constraint fit

SM Higgs

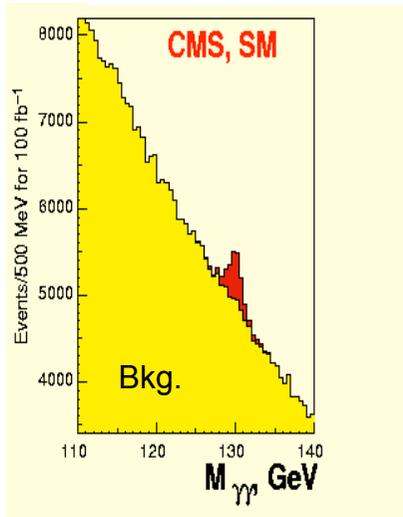

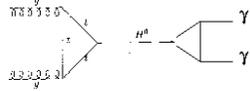

3 main production modes

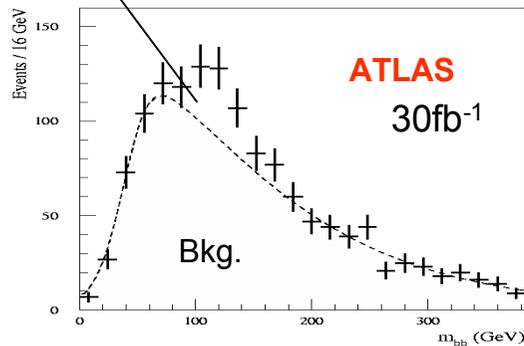

$>10^5$ Higgs
for 500 fb^{-1}

LHC Higgs signal

$$H \rightarrow \gamma\gamma$$

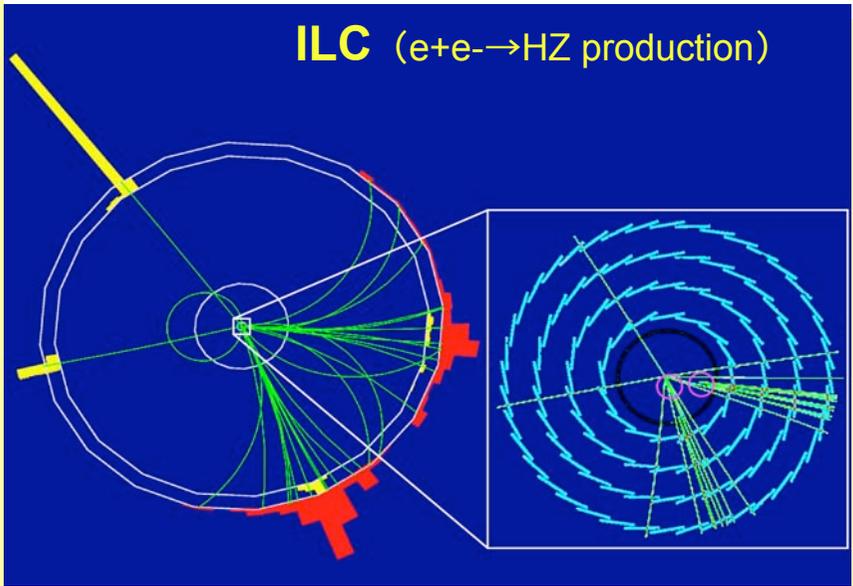

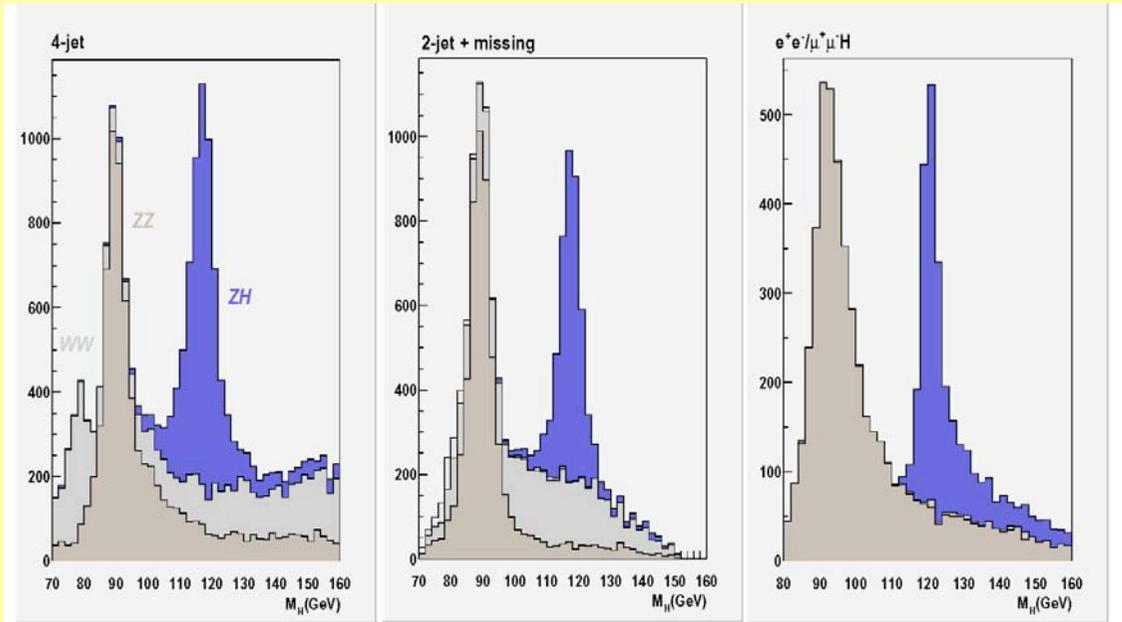

$$ttH \rightarrow WbWbb \rightarrow l\nu jj bbbb$$

Aug.17 2005

ILC Higgs signal

ILC ($e+e- \rightarrow HZ$ production)

Typical numbers

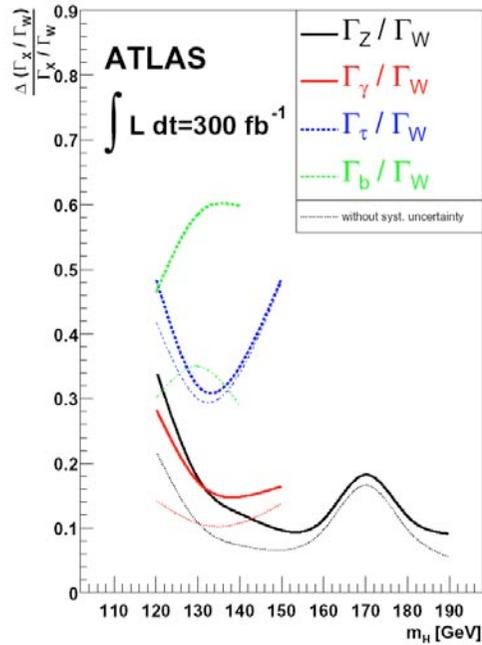

Tagging efficiency
~ 30-50 %

S/N > 1

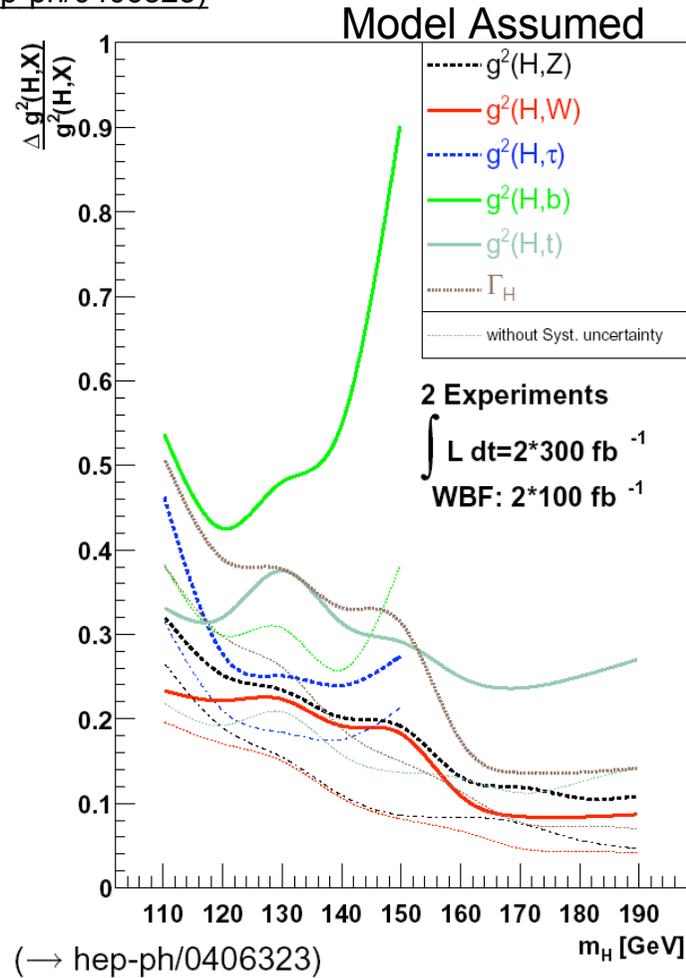

Higgs coupling measurements at LHC

Ratio can be obtained using events with “similar” topology

Michael Duhrssen et al. '04 (hep-ph/0406323)

Γ_{tot} is unknown..
Absolute strength is difficult to measure

Using moderate model assumption

Limit on g_W^2 and g_Z^2 :

$$\frac{g_W^2}{g_W^2(\text{SM})}, \frac{g_Z^2}{g_Z^2(\text{SM})} < 1 + 5\%$$

For Mh 115-150 GeV

$$\delta\Lambda_\tau / \Lambda_\tau \sim 15\%$$

$$\delta\Lambda_b / \Lambda_b > 20\%$$

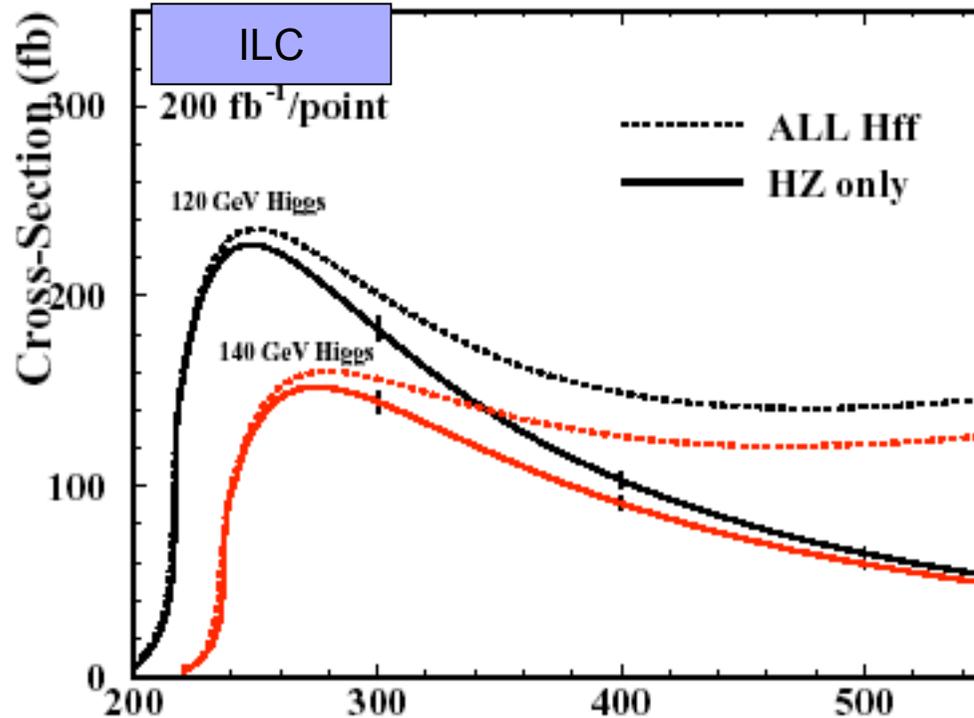

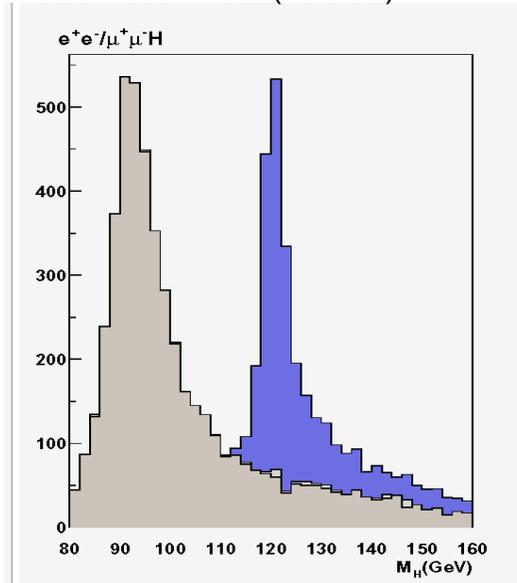

Mainly from ttH process

$$\delta\Lambda_{\text{top}} / \Lambda_{\text{top}} \sim 15-20\%$$

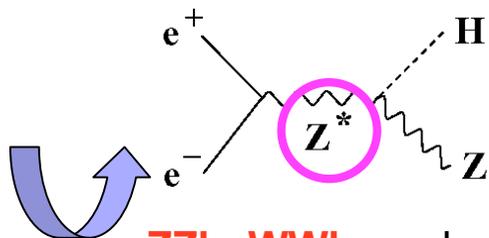

ILC Higgs

Invisible width

Use Recoil mass(no bias)

Beam polarization

ZZh, WWh production
(selectable)

CP, SU(2)_LxU(1)

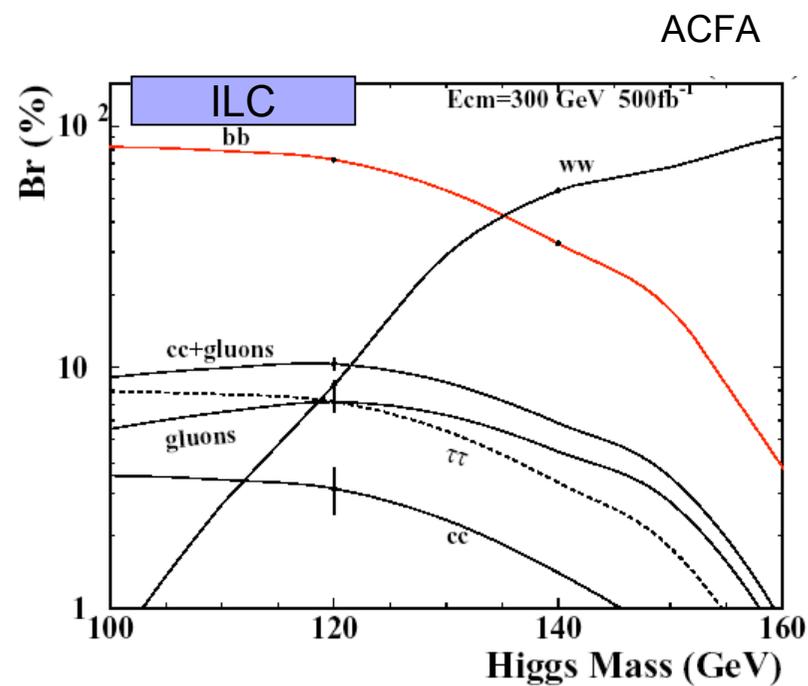

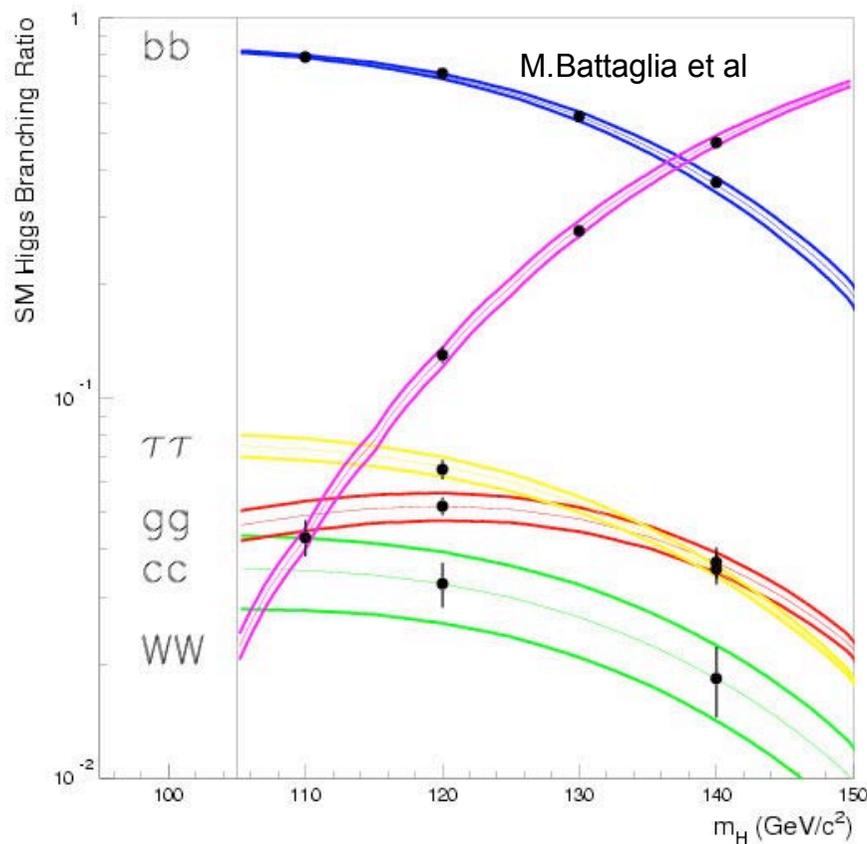

Mass & Cross-section measurement
= **Gauge coupling** measurement

$$\Gamma_W = f(M_h) \times \sigma$$

$\delta g/g \sim 1\%$

$\delta M_h \sim 40 \text{ MeV}$

Branching ration measurements

ILC Examples of Higgs *Model Independent* Analyses

$$\Gamma_{h^0 \rightarrow W^+W^-} = \Gamma_{h^0 \rightarrow W^+W^-}^{\text{SM}} \times \frac{\sigma_{h^0 Z^0}}{\sigma_{h^0 Z^0}^{\text{SM}}}$$

$$\Gamma_{h^0} = \frac{\Gamma_{h^0 \rightarrow W^+W^-}}{\text{Br}(h^0 \rightarrow W^+W^-)} = \Gamma_{h^0}^{\text{SM}} \times \frac{\text{Br}^{\text{SM}}(h^0 \rightarrow W^+W^-)}{\text{Br}(h^0 \rightarrow W^+W^-)} \times \frac{\sigma_{h^0 Z^0}}{\sigma_{h^0 Z^0}^{\text{SM}}}$$

$$\lambda_f^2 = \lambda_{f,SM}^2 \times \frac{\text{BR}(h^0 \rightarrow f\bar{f}) \cdot \sigma_{\text{HZ}} \cdot \text{BR}^{\text{SM}}(h^0 \rightarrow W^+W^-)}{\text{BR}^{\text{SM}}(h^0 \rightarrow f\bar{f}) \cdot \sigma_{\text{HZ}}^{\text{SM}} \cdot \text{BR}(h^0 \rightarrow W^+W^-)}$$

Total width measurement

$$\Gamma_{\text{tot}} = \Gamma_W / \text{Br}(H \rightarrow WW)$$

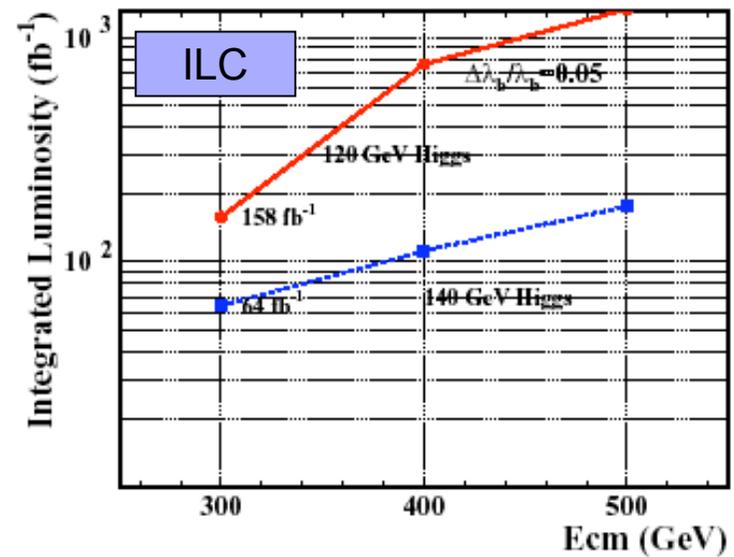

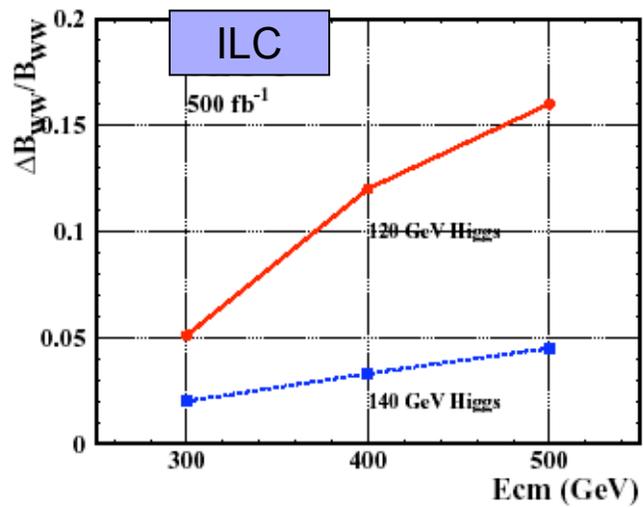

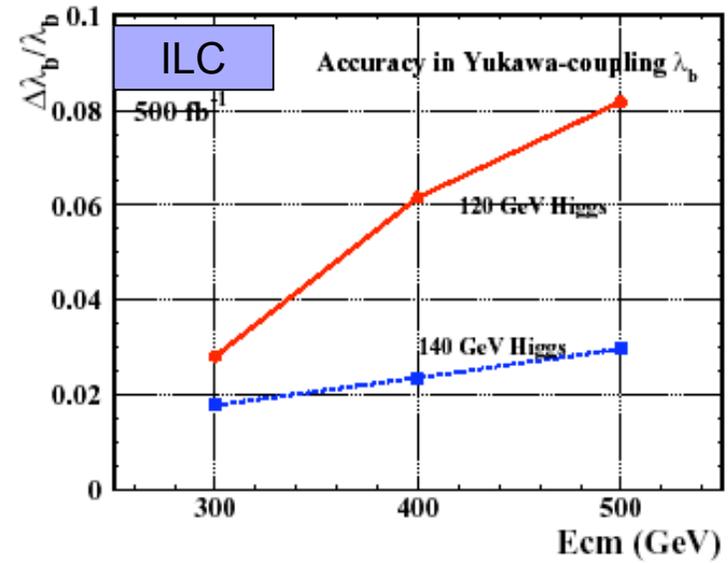

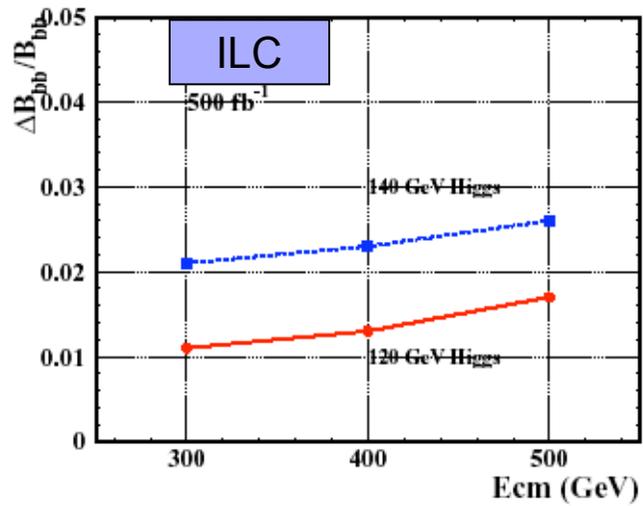

$$\delta\Gamma_{\text{tot}} / \Gamma_{\text{tot}} \sim 5\%$$

Absolute strength of Yukawa-Coupling determination

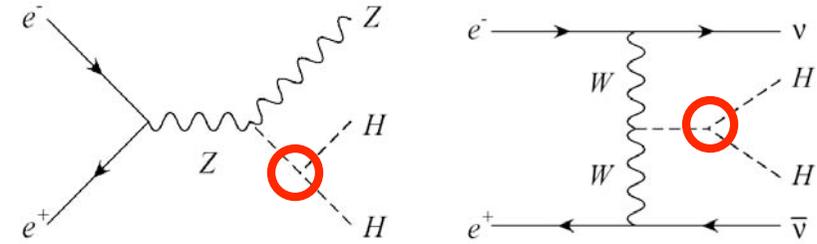

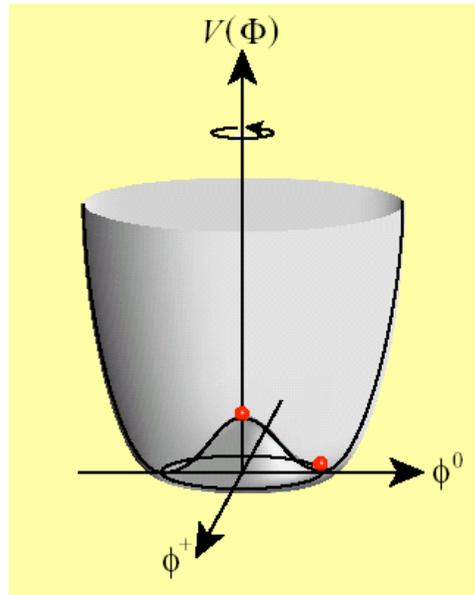

$$\Lambda_f^2 = C(M_h) \times \text{Br}(H \rightarrow f\bar{f}) \times \Gamma_{\text{tot}}$$

$$\delta\Lambda_b / \Lambda_b \sim 3\%, \quad \delta\Lambda_t / \Lambda_t \sim 4\%,$$

$$\delta\Lambda_c / \Lambda_c \sim 8\%, \quad \delta\Lambda_U / \Lambda_U \sim 4\%$$

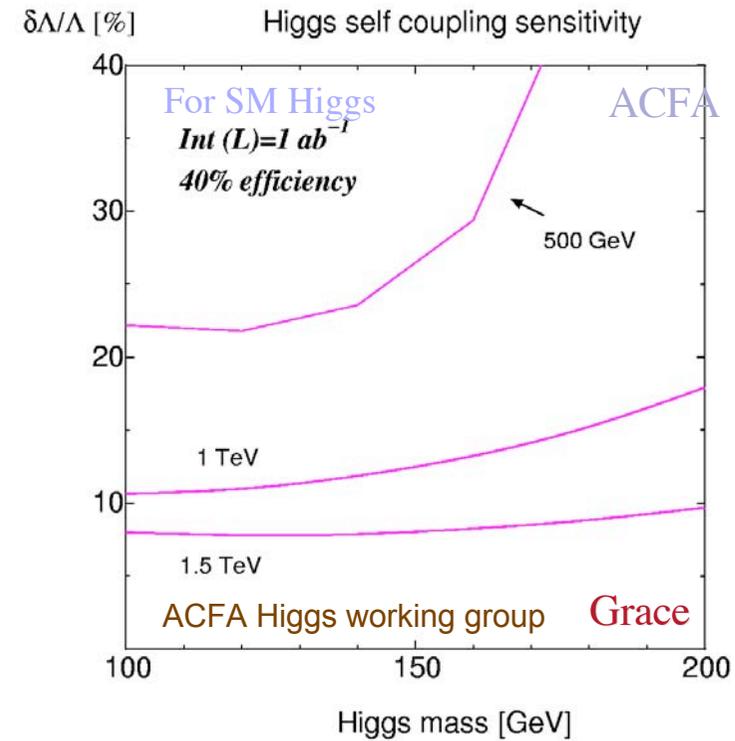

Higgs potential = Origin of EW symmetry breaking

The first access to the Higgs potential through double Higgs-boson production.

$\delta\Lambda/\Lambda \sim 10 - 15 \%$

Higgs Mechanism

Coupling-mass relation

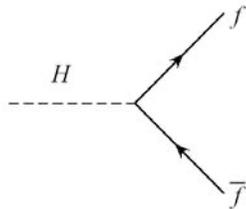

The Higgs vacuum-expectation-value

$$m_i = v \times K_i$$

Branching ratio measurements

Invisible width

Use Recoil mass (no bias)

Total width measurement

$$\Gamma_{\text{tot}} = \Gamma_W / \text{Br}(H \rightarrow WW)$$

$\delta \Gamma_{\text{tot}} / \Gamma_{\text{tot}} \sim 5\%$

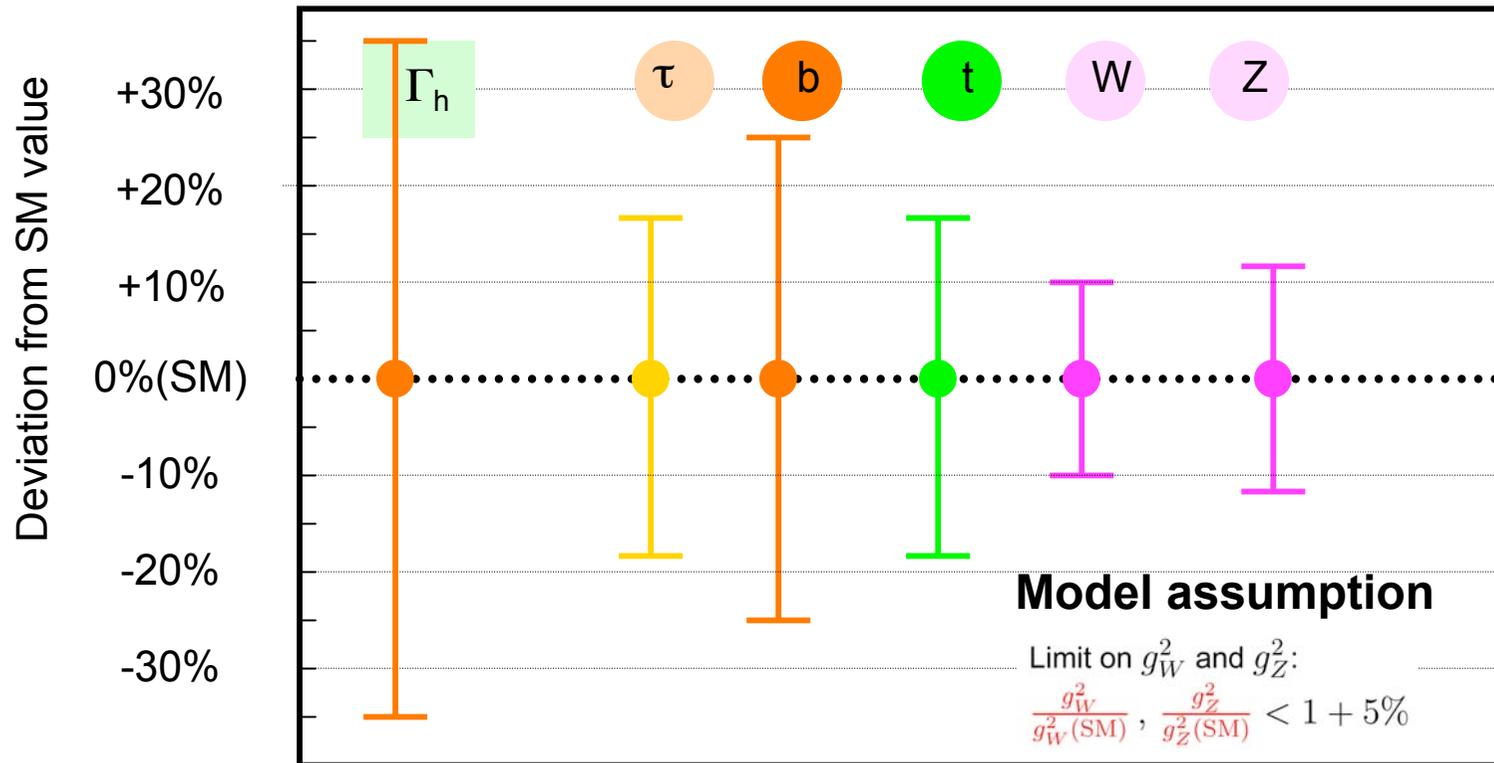

Absolute strength of Yukawa-Coupling determination

$$\Lambda_f^2 = C(M_h) \times \text{Br}(H \rightarrow ff) \times \Gamma_{\text{tot}}$$

$\delta \Lambda_b / \Lambda_b \sim 3\%$, $\delta \Lambda_\tau / \Lambda_\tau \sim 4\%$,
 $\delta \Lambda_c / \Lambda_c \sim 8\%$, $\delta \Lambda_U / \Lambda_U \sim 4\%$

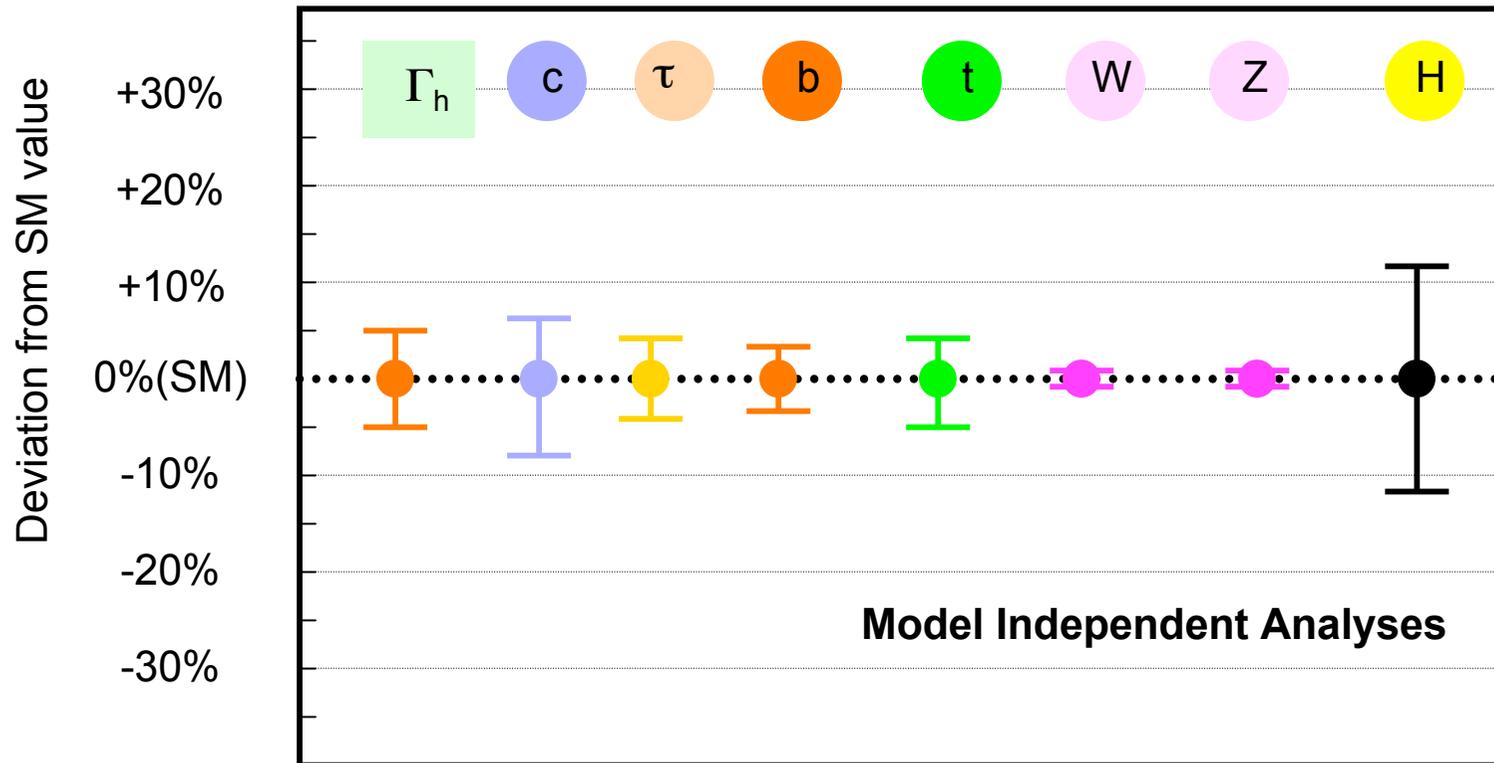

Coupling Precision

LHC 300 fb⁻¹ x 2

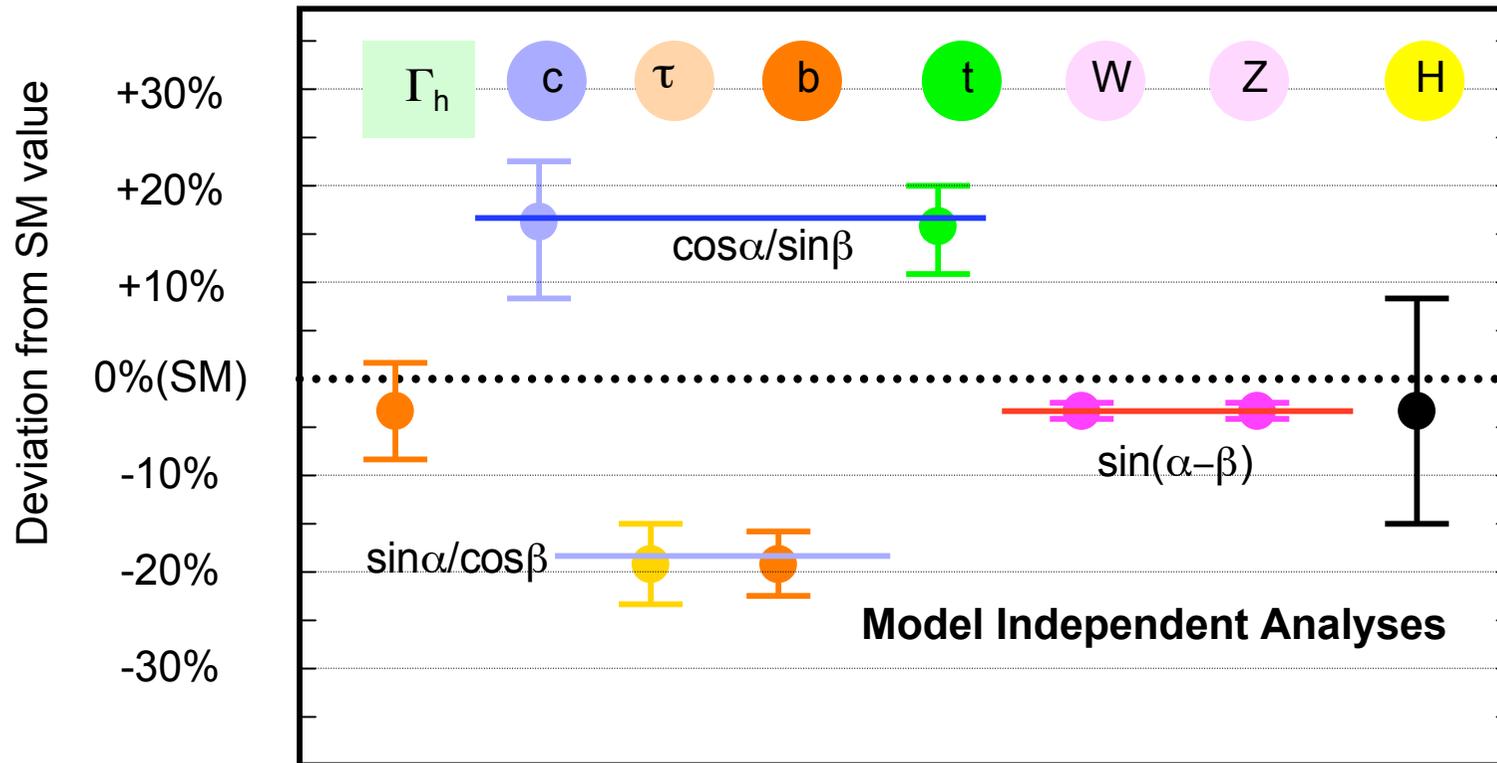

Coupling Precision

ILC

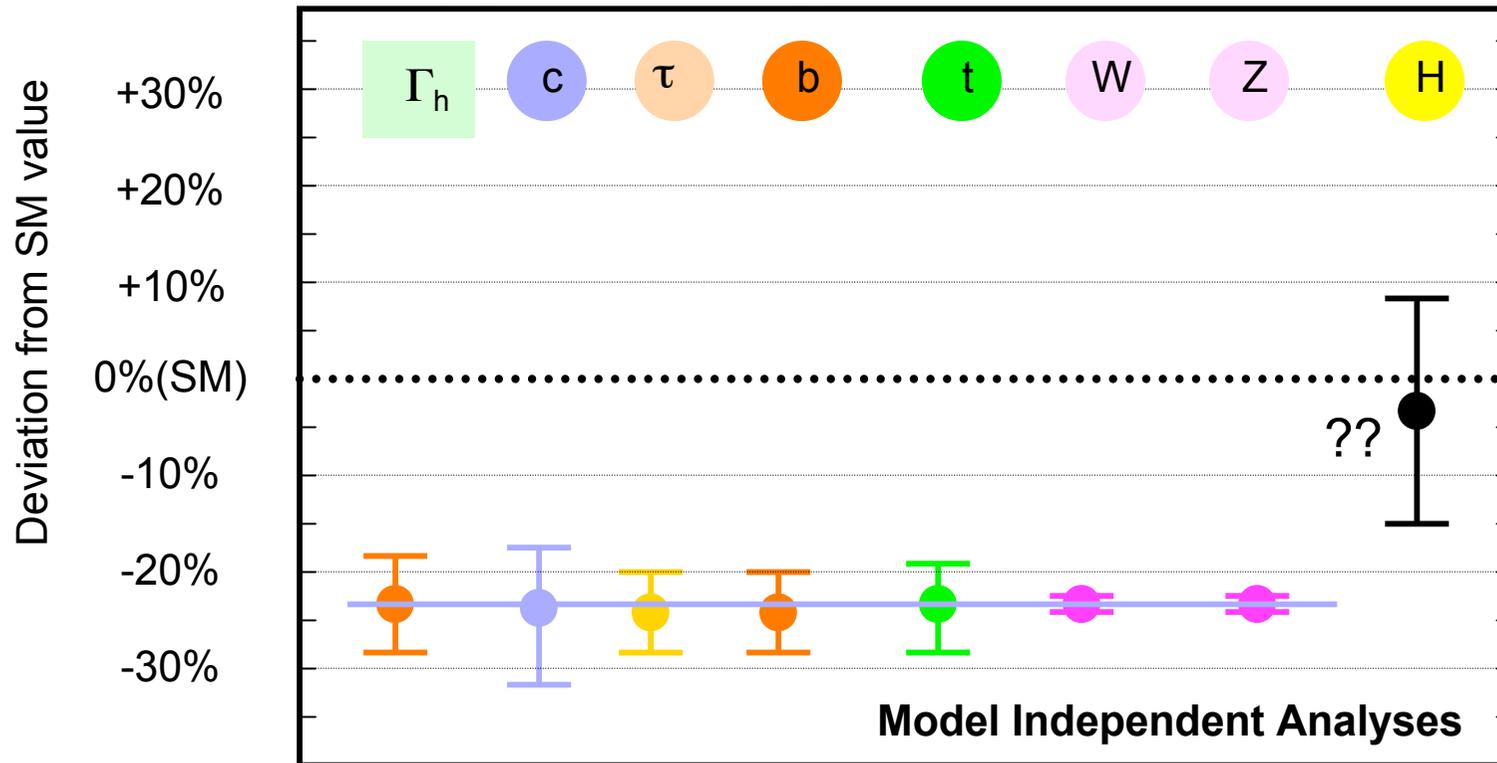

SUSY or 2HDM

ILC

Extra-dimension (radion-Higgs mixing)

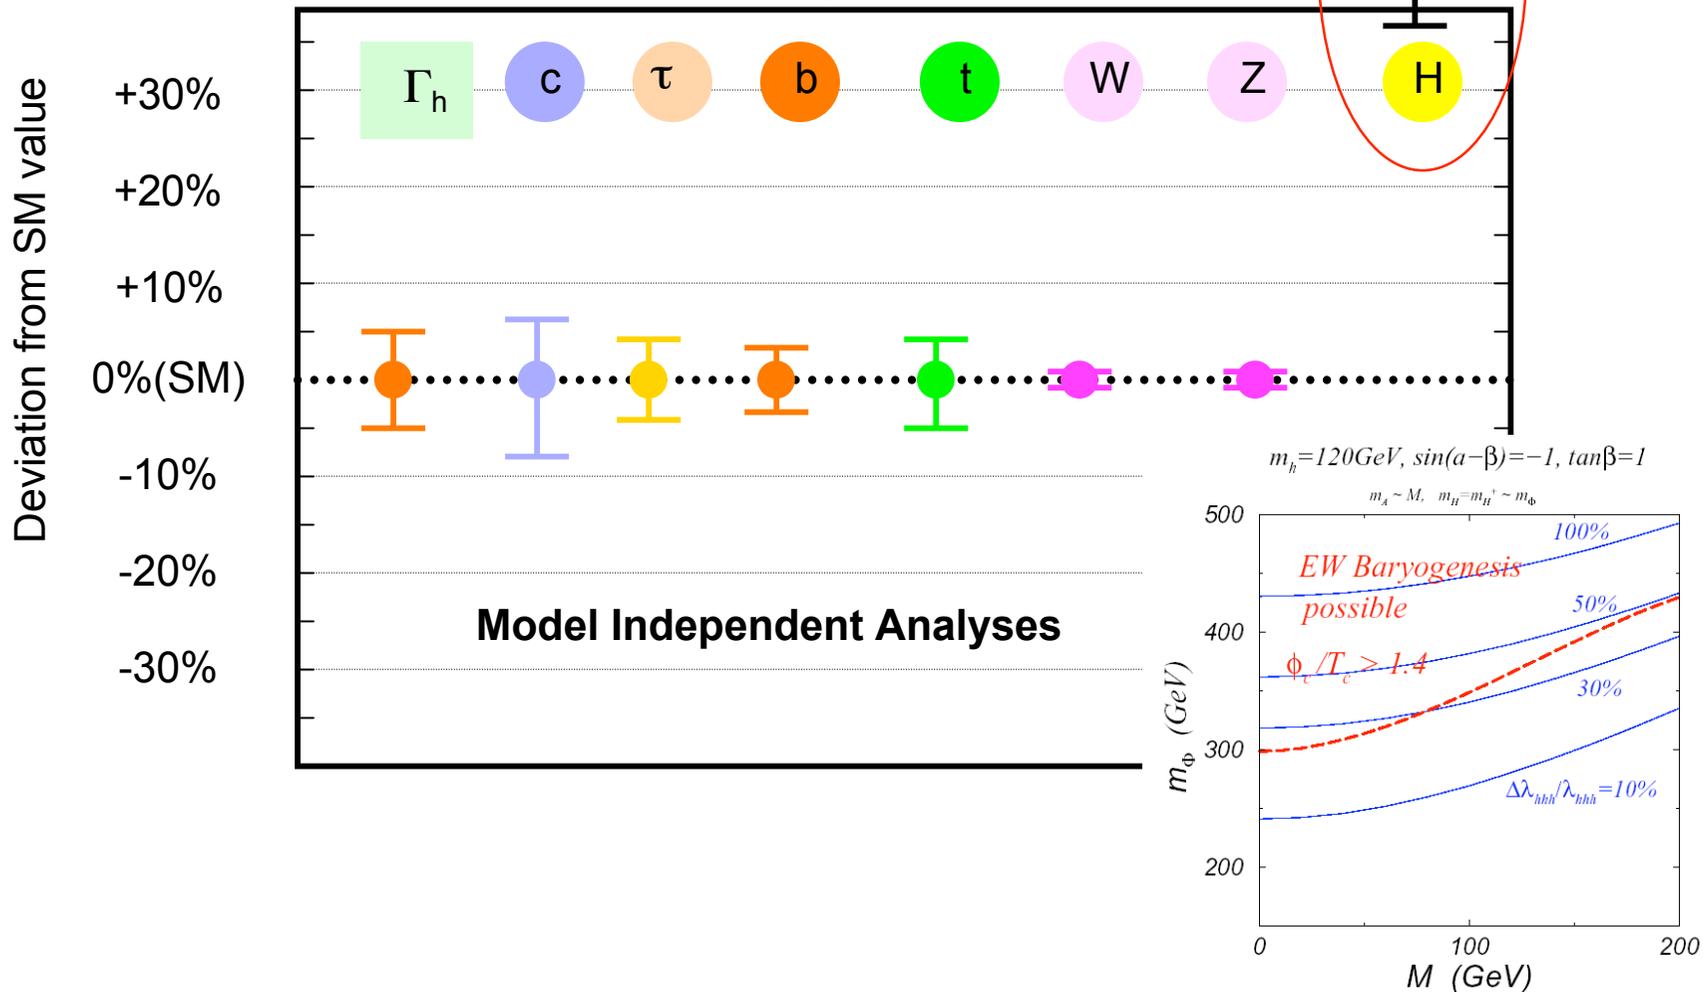

ILC

Electroweak Baryogenesis

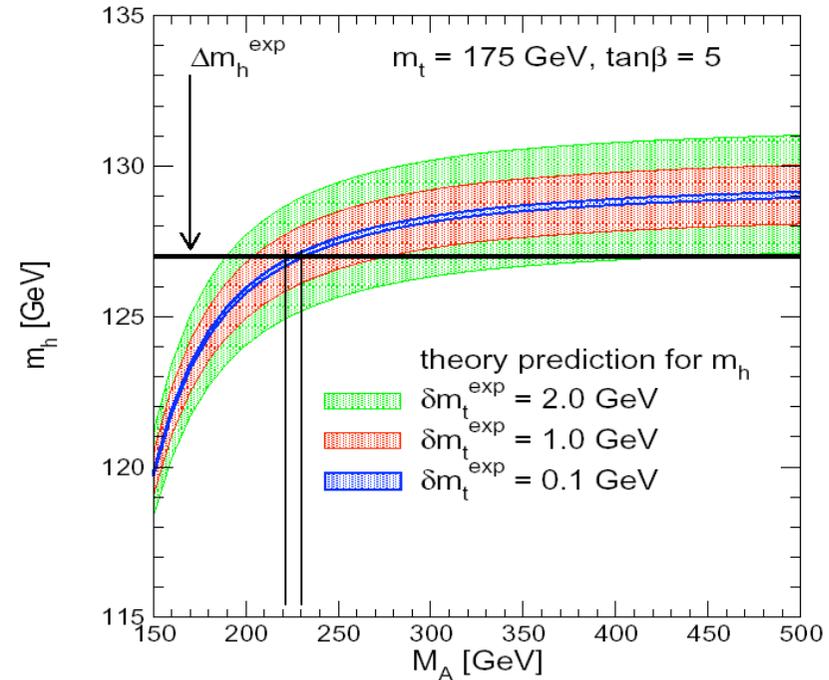

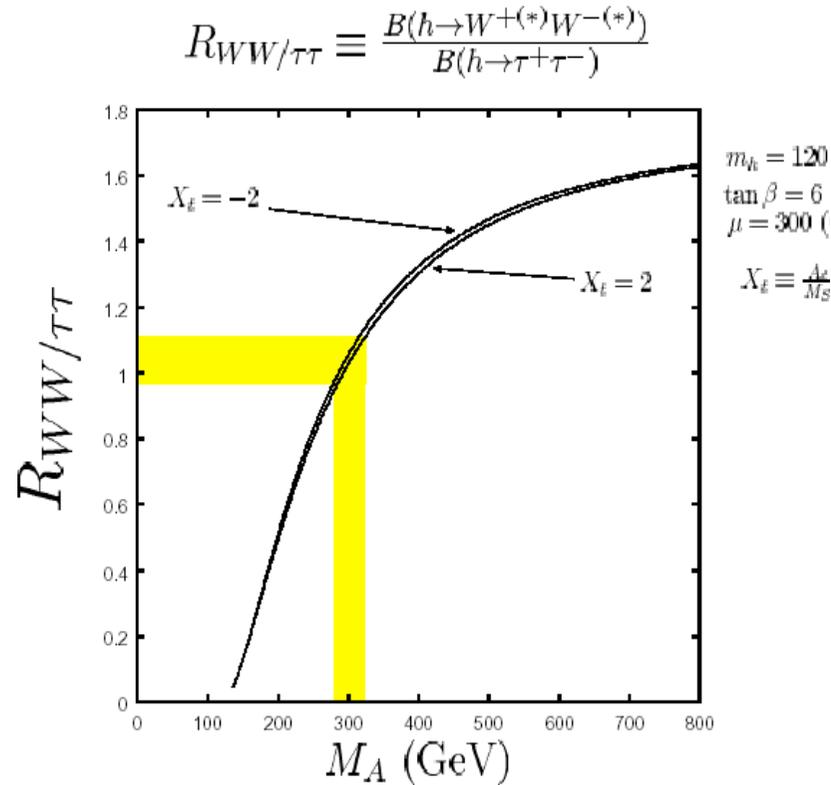

ILC

(S.Kanemura, Y.Okada, E.Senaha '04)

More than one Higgs boson?

h, H, A, H^\pm in the Minimal Supersymmetric Standard Model.

Accurate coupling measurements tell us M_A

Top mass is also essential

Direct and indirect searches for heavy Higgs bosons at ILC.

What to do (from experimental technical point of view)

Key analyses techniques are:

1. Jet finding / jet clustering
2. Jet energy calculation
3. b, c, top, tau tagging
4. W, Z tagging
5. Kinematic constraint fit

--> All techniques and results must be UPDATED

Mpst Fundamental Issues to be clarified

Gauge coupling

Yukawa-coupling

- Up-type vs Down-type top vs bottom (charm vs bottom)
- Quark vs lepton bottom vs tau
- 2nd generation vs 3rd generation mu vs tau, charm vs top

Self-coupling

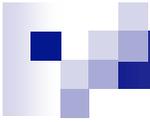

---> We should clarify well the research potential of Higgs mass dependence for $M_h > 160$ GeV

What to do (requests to theorists)

Discrimination among various models

Translation of the deviation from SM into quantity in New physics models

- More concrete examples of model selection,
- Show ILC mass (energy scale) reach for new physics
- Please add many models (new/old) and summarize the power of Higgs study at ILC !
