# Safety in Cryogenic Operations at RHIC \*

Anthony Nicoletti, Dewey Lederle, Ahmed Sidi-Yehklef, Tom Tallerico, Roberto Than, Joe Tuozzolo Collider-Accelerator Department Brookhaven National Laboratory Upton, NY

### RELATIVISTIC HEAVY ION COLLIDER

- Super Conducting Particle Accelerator commissioned in 1999
- Two 2.4 mile circumference magnet rings
- Over 1700 magnet assemblies
- Six beam intersecting regions for experimenters
- Part of the Booster AGS RHIC accelerator complex
- Used by a community of more than 1000 physicists from over 20 countries

# RHIC Cryogenic System

- Main Refrigerator 24.8 kW at 3.8K, 55kW at 55K
- Built and commissioned in the early 1980's as part of the ISABELLE accelerator
- Lay dormant until 1997

   restored for the RHIC
   First Sextant Test
- Modified to meet present RHIC requirements

- 6 Operating Rotoflow Turbine Expanders
  - 4 Warm 2 Cold
  - Redundant string available
- Howden Screw Compressors
  - 20 600 HP FS. Presently run 8
  - 5 2250 HP SS. Presently run 3
- Each ring is divided into 6 sextants by beam crossing regions
  - Cryo Valve Box located at each crossing region
  - Each sextant can be individually isolated for warm-up and magnet repair while maintaining the rest of the collider cold
- Liquid Nitrogen based collider precooler/ 80K soak (maintenance) system
  - Independent of main refrigerator

#### **OPERATIONS**

- RHIC warms up during the summer
  - Power rates preclude year round running
- To date RHIC has been cooled down 6 times
  - Currently in run 6 scheduled to warm up end of June
  - This year the plan is to maintain the collider at 80K during the shutdown – first time
- Physics runs average about 30-35 weeks
- Cool down to 80K with LN2 based precooler
  - 4 weeks typical cooldown time
- Operating He Inventory ~ 6 million scf
  - 2/3 is stored off site as liquid during shutdowns
- Currently operate with a 2 man rotating shift-24/7
  - One shift supervisor and one mechanical tech

## **General Safety Policies**

- Work Planning
  - Procedures
    - Cryo Operations are procedure based
    - Procedures are written and reviewed within the cryo group initially, then reviewed by departmental safety personnel
    - OPM's are stored on C-AD web site and are easily accessible
    - Mandatory review every 3 years
    - Note: C-AD has a separate ESH Division for independent review that reports directly to the department chair
- Training
  - Annual training required on ODH, radiation, confined space, electrical safety, etc
  - Reminders emailed when training is due
  - Emails sent to supervisors when training has lapsed
  - Training records available on web
  - Training record is a part of performance reviews

"Green Sheet"

- Work control document
- Associated with all work done in the department
  - Removing compressors for repair, work in a cold box...
- Lists potential hazards associated with any job
- Hazard level defines review level
- Attach procedures, loto lists... any relevant documentation
- Documents pre job briefings, post job walkthroughs, lessons learned
- Reviewed, approved, and documented by ESH division

#### General Policies - Continued

- Confined Space
  - Confined space watch and fire watch if welding
  - Log in and out with watch
  - Confined spaces clearly labeled
  - Constant monitoring of air quality inside cold box while occupied
  - Personal POM's required for entry
  - Constant air flow purge set up
  - Confined space training required
- Noise Monitoring
  - Technicians have worn noise monitors to determine average exposure level
  - Double hearing protection and working time limits imposed in compressor and refrigerator buildings

#### **General Policies - Continued**

•Shift Rounds(presently 2 man 24/7 shift coverage)

- •Single man rounds are acceptable
- •Regular communication with Cryo Control Room
- •Collider Accelerator Support (CAS- Two man 24/7 shift) available if necessary
  - •"Floating" technician help.
  - •Assists when a two man job is needed during overnight shifts

#### •Relief Valve Recertification

- •Take advantage of RHIC summer shutdowns to ASME recertify relief valves as part of preventative maintenance
- •Found some original Isabelle refrigerator relief valves needed rework
- •5 year rotation implemented.
- •Will continue based on experience gained

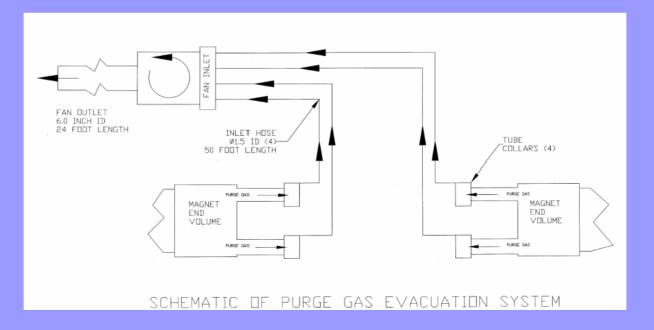

### General Lock Out Tag Out

- Implemented at the beginning of every summer shutdown
- Isolates any potential sources of Helium from the system
  - Warm gas storage tanks
  - Helium Storage dewars
  - Main Compressors
  - Auxiliary Compressor
  - Gas makeup tanks
  - Liquid Nitrogen Dewar
  - Turbine buffer tanks
- Typically backed up by lock/out tag out local to job

#### Magnet Repair During Shutdown

- General Lock out/tag out in place, backed up by local LOTO at adjoining valve boxes
- N2 Purge maintained to minimize moisture propagation
- Area cordoned of personal O2 monitors required
- Air quality checked every morning
- System setup to minimize N2 release into the tunnel

#### Single Sextant Warm Up

- On several occasions, a run has been stopped and a sextant warmed up to repair a magnet.
  - On one occasion three sextants were warmed up
- Performed under "Green Sheet" work controls with detailed procedures written and reviewed for every step
- Local Lock out/tag
  - Sextant to be warmed isolated at cryo valve box at either end
- Isolate and drop pressure in adjacent sextants
  - Pressure is monitored and alarmed in cryo control room
- Maintain helium purge while system is open to minimize water propagation
  - Personal Oxygen monitor required in areas where magnets is open
  - Tunnel Air quality local to open magnet checked every morning
- Ability to maintain the other ring at operating conditions
- Ability to maintain parts of ring being repaired at operating conditions but this is not necessarily done

#### Oxygen Deficiency Hazards

- 0,1,2.. Classification
  - ODH Class is based on the calculated probability of a fatality
  - Calculate
    - fatality factor determined from the lowest oxygen concentration based on worst case release rates
    - probability of event using equipment failure rates
    - fatality rate determined from first two
- Determine ODH Class by the predicted fatality rate.
- Ensure that ODH control measures are implemented

Classification	Training/Access Requirements	Areas		
0	Collider Access Training	RHIC Tunnel		
		Main Compressor Building Auxiliary Compressor Building		
1	Specific ODH Training Respirator tests during physical Personal O2 Monitor 5 minute Air escape pack	RHIC Refrigerator Building		

#### ODH -cont

- Cold Helium Spill Test (1999)
  - Released Cold Helium into the RHIC tunnel to verify effectiveness of ODH system
- Warm Nitrogen Release Test (2005)
  - Nitrogen is used to purge any magnet repair being made during a shutdown
  - The amount of purge N2 introduced into the accelerator is controlled and monitored
  - A spill test was performed in the RHIC tunnel to confirm the adequacy of the ODH system in the presence of N2 and to compare to theoretically predicted N2 distribution
  - Matched theoretically predicted concentrations within reason

# Cryogenic Safety Reviews

- Interdepartmental committee reviews all new cryogenic installations
- Reviewed for
  - Maximum design/Allowable working pressures and pressure vessel, piping and component ratings
  - Total quantity of cryogens;
  - Maximum release rates
  - Heat flux assumptions
  - Pressure relief capabilities;
- Quench protection (if necessary);
- If used in a ionizing radiation environment, calculations of gram quantities of explosive materials generated (such as ozone and oxides of nitrogen);
- Stress Analyses
- Adherence to applicable codes- ASME Boiler & Pressure Vessel, B31.3
- Materials used suitability for low temperatures
- Oxygen Deficiency hazard classification calculations
- Operating procedures/emergency procedures;
- Training requirements/personnel training status.

#### Lessons Learned

- 2002: Technician replacing solenoid was splashed with hot oil
  - Technician was intending to replace a faulty solenoid valve
  - Disassembled valve body instead of removing solenoid
  - This was on a pressurized oil line
  - Lesson learned Establishing technician competence for the job is part of work planning
- 2004: Technician burned his hand on heater
  - Technician working in a cold box leaned on a hot calorimeter
  - Hand received first degree burn
  - Power switch to heater was turned off it was assumed to be ok however circuit breaker was not locked out
  - Determined short in heater and faulty switch caused heater to be powered
  - Stop work issued on all valve box work until a complete review of all power and energy sources was completed and documented
  - Lesson learned make no assumptions.LOTO must be complete

### 2006 Refrigerator Upgrades

- Rework this summer (RHIC Refrigerator Upgrade presentation by Dr. Sidi Yekhlef)
- This work will be completed on the refrigerator while the Collider is being maintained at 80K
  - Green sheet and work planning
  - Operations group planning and review
  - Review and approval by Cryogenic Engineering Group Supervisor (Dr. Sidi Yekhlef)
  - Two locked valves minimum between 80K ring and open refrigerator lines
  - Monitoring of valve leakage in the volume between locked out valves
