## NEUTRINOS AND FUTURE CONCORDANCE COSMOLOGIES

Neutrino 2008 / Richard Easther (Yale)

## INTRODUCTION...

- Integrated History of the Universe...
- Probes:
- CMB
- Large scale structure
- 21 cm
- Summary...

## Cosmology: Overview

Image: NASA

## COSMOLOGY: OVERVIEW

Overall expansion...

## COSMOLOGY: OVERVIEW

Stars, galaxies...

## COSMOLOGY: OVERVIEW

Dark Ages...

## Cosmology: Overview

## COSMOLOGY: OVERVIEW

## CONCORDANCE COSMOLOGY

| $\Omega_{\mathrm{b}}$ | Baryon fraction <br> (Mass known, \#??) | Baryogenesis <br> (? - GUT, Electroweak?) <br> TeV Scale physics?? |
| :---: | :---: | :---: |
| $\Omega_{\mathrm{CDM}}$ | Dark matter <br> (Mass ??, \#??) <br> Supersymmetry? LHC? |  |
| $\Omega_{\Lambda}$ | Cosmological constant <br> Quantum Gravity <br> Tooth fairy? |  |
| $\tau$ | Reionization | First stars (gastrophysics, <br> nuclear physics) |
| h | Hubble's "constant" | When we are looking |
| $\mathrm{A}_{\mathrm{s}, \mathrm{n}}$ | Primordial <br> Perturbations | Inflation <br> GUT / string physics? |

## THE FUTURE...

- Parameter set will expand
- Neutrino sector! Scale dependence of n? Dark energy parameters? Tensor modes? Helium fraction? Curvature? Secondary anisotropies?
- Parameter set will shrink
- Neutrino masses from experiments?
- Recombination observed directly in 21 cm ?
- Specific models of inflation?

## NUMBERS...

- Photons: $\mathrm{T}_{\gamma}=2.726 \mathrm{~K}=2.3510^{-4} \mathrm{eV}$ (measured)
- Massless $v: \mathrm{T}_{\mathrm{v}} \sim 1.9 \mathrm{~K}=1.710^{-4} \mathrm{eV}$ (inferred)
- Photons at $\mathrm{z}=1,089: \mathrm{T}_{\gamma}=2.9710^{3} \mathrm{~K}=0.255 \mathrm{eV}$
- Massless v: $\mathrm{T}_{\mathrm{v}} \sim 2.0710^{3} \mathrm{~K}=.17 \mathrm{eV}$
- Minimum $\Sigma \mathrm{m}_{v} \sim 0.05 \mathrm{eV}$ (normal hierarchy)
- Change in equation of state as universe expands!

## CMB: WMAP

## BEST FIT

- Early universe is a simple system
- General relativity and small inhomogeneities
- $\mathrm{e}^{-}, \mathrm{p}, \mathrm{He}$ nuclei, dark matter, $v, \gamma$, also $\Lambda, \mathrm{H}_{\mathrm{o}}$ and k
- Boltzmann equations
- Beautiful and largely classical classical physics
- Compute $\mathrm{C}_{1} \&$ polarization (E and B mode)

## THE SPECTRAL INDEX

## THE BARYON FRACTION 0.01695

## HUBBLE PARAMETER

## WHAT DO WE LEARN?

| Class | Parameter | WMAP 5-year ML |  |  |  |
| :---: | :--- | :---: | :---: | :---: | :---: |
| Primary | WMAP+BAO+SN ML | WMAP 5-year Mean ${ }^{b}$ | WMAP+BAO+SN Mean |  |  |
|  | $100 \Omega_{b} h^{2}$ | 2.268 | 2.263 | $2.273 \pm 0.062$ | $2.265 \pm 0.059$ |
|  | $\Omega_{c} h^{2}$ | 0.1081 | 0.1136 | $0.1099 \pm 0.0062$ | $0.1143 \pm 0.0034$ |
|  | $\Omega_{\Lambda}$ | 0.751 | 0.724 | $0.742 \pm 0.030$ | $0.721 \pm 0.015$ |
|  | $n_{s}$ | 0.961 | 0.961 | $0.963_{-0.014}^{+0.015}$ | $0.960_{-0.014}^{+0.013}$ |
|  | $\tau$ | 0.089 | 0.080 | $0.087 \pm 0.017$ | $0.084 \pm 0.016$ |
|  | $\Delta_{\mathcal{R}}^{2}\left(k_{0}{ }^{e}\right)$ | $2.41 \times 10^{-9}$ | $2.42 \times 10^{-9}$ | $(2.41 \pm 0.11) \times 10^{-9}$ | $\left(2.457_{-0.093}^{+0.092}\right) \times 10^{-9}$ |
| Derived | $\sigma_{8}$ | 0.787 | 0.811 | $0.796 \pm 0.036$ | $0.817 \pm 0.026$ |
|  | $H_{0}$ | $72.4 \mathrm{~km} / \mathrm{s} / \mathrm{Mpc}$ | $70.3 \mathrm{~km} / \mathrm{s} / \mathrm{Mpc}$ | $71.9_{-2.7}^{+2.6} \mathrm{~km} / \mathrm{s} / \mathrm{Mpc}$ | $70.1 \pm 1.3 \mathrm{~km} / \mathrm{s} / \mathrm{Mpc}$ |
|  | $\Omega_{b}$ | 0.0432 | 0.0458 | $0.0441 \pm 0.0030$ | $0.0462 \pm 0.0015$ |
|  | $\Omega_{c}$ | 0.206 | 0.230 | $0.214 \pm 0.027$ | $0.233 \pm 0.013$ |
|  | $\Omega_{m} h^{2}$ | 0.1308 | 0.1363 | $0.1326 \pm 0.0063$ | $0.1369 \pm 0.0037$ |
|  | $z_{\text {reion }}{ }^{f}$ | 11.2 | 10.5 | $11.0 \pm 1.4$ | $10.8 \pm 1.4$ |
|  | $t_{0}{ }^{g}$ | 13.69 Gyr | 13.72 Gyr | $13.69 \pm 0.13 \mathrm{Gyr}$ | $13.73 \pm 0.12 \mathrm{Gyr}$ |

WMAP 5 +

- Count the significant figures...
- Cosmology graduated from back of the envelope!

## TOTAL NEUTRINO MASS

## ERROR FORECASTS <br> (Rough \& Overly Optimistic)

Planck'
"Ideal"
Perfect

## CURRENT CONSTRAINTS

- WMAP5 + All
- Care needed
- Priors
- Systematics between datasets
- $\Sigma \mathrm{m}_{v}<\sim 1 \mathrm{eV}$

## LARGE SCALE STRUCTURE

## LARGE SCALE STRUCTURE \& LENSING

- Galaxies clustered in space
- Bubbles and voids
- Orthogonal information to microwave background
- Large scale structure
- Get power spectrum $P(k)$
- Break degeneracies
- Nonlinear at short scales (function of redshift)

## MATTER POWER...

## HIGH-REDSHIFT 21CM

- Before first stars, universe is mostly neutral H
- Neutral hydrogen emits a 21 cm line
- Redshifted; H at redshift 10: 2.1 meters.

## HIGH-REDSHIFT 21CM

- Observe sky at ~100 MHz
- Remove foregrounds (!)
- Map neutral hydrogen density as a function of $z$
- Needs radio-quiet location
- Get "slices" by tuning receiver

(Steve Furlanetto)

## HIGH-REDSHIFT 21CM

- Instruments
- Mileura (Australia)
- LOFAR (Belguim)
- SKA (To be decided)
- Lunar Array (Far side of the moon / vaporware!)

## PROSPECT FOR NEUTRINOS

- First observations: "Low" redshift
- Focus on reionization / first stars
- Longer term: High redshift
- Weaker signal
- Probe short wavelengths (uncollapsed)
- Perturbations small; challenging experiments
- Foregrounds??? Terrestrial noise???

## A BOLD PREDICTION?

- Total mass: 0.3 eV
- Nonlinear scales at $\mathrm{z}=0.3,4$ and 8

Pritchard and Pierpaoli

## A BOLD PREDICTION?

- Total mass 0.12 eV
- Both hierarchies
- Solid z=8
- Theoretically distinguishable

Pritchard and Pierpaoli

## COMMENTS AND CONCLUSIONS...

- Neutrinos provide definite target
- Very good reason to believe they are there (WMAP)
- We know their total mass is non-zero
- Probe thermal history of very early universe
- Small effect: precision cosmology
- Terrestrial measurements of neutrino mass constrain other cosmological parameters

## COMMENTS AND CONCLUSIONS...

- Current bound ~10 times larger than minimum $\Sigma \mathrm{m}$
- Next few years: Planck, ACT, EBEX, DEC
- Better SN1a bounds \& BAO, first 21cm data
- Somewhat longer term: JDEM, LSST, CMBPol (?)
- Very long term: High precision high-z 21 cm
- GUESS: A factor of 10 on $\mathrm{\Sigma m}$ in 10 years??
