KASHIYAMA IND., LTD.
HANDLING OF MANUAL

This instruction manual describes installation, operation, and maintenance about the MuDry Series Dry Vacuum Pump. Be sure to read this instruction manual to correctly operation before installing and operating it. In particular, take care about the precautions for safety to following warning words.

⚠️ DANGER

This indicates the existence of imminent hazard, which if the equipment is operated without respect to its contents, will result in death or a serious injury of the operator.

⚠️ WARNING

This indicates the existence of potential hazard, which if the equipment is operated without respect to its contents, will result in death or a serious injury of the operator.

⚠️ CAUTION

This indicates the existence of potential hazard, which if the equipment is operated without respect to its contents, may result in slight injury or less serious injury of the operator.

⚠️ CONFIRMATION

This indicates the existence of possibility, which if the equipment is operated without respect to its contents, may result in equipment damage.

<STORAGE OF THIS INSTRUCTION MANUAL>

This instruction manual describes important matters related to pump operation. Keep the manual in an easy-to-see place so that it may be available whenever required.
WARRANTY OF THE DRY PUMP

Any failure attributable to our responsibility which is due to a defect of design, material, manufacturing, and occurs within one year after acceptance shall be repaired or replaced free of charge.

This warranty shall be applicable only to the case where the equipment has been correctly operated in accordance with this instruction manual and other instructions.

The execution of repair and modification by any party other than our company and our approved dealers shall be prohibited.

Moreover, this warranty shall not be applicable to the following failures.

* Failure due to improper handling, operation or storage.
* Failure due to negligence of necessary maintenance.
* Failure due to use of maintenance/replacement parts other than those made by us.
* Failure due to fire, flood, earthquake, lightning and other force majeure.

In addition, this warranty shall not be applicable to a failure or maintenance that will be necessarily caused by using the equipment for special gas exhaust such as acid, alkali, corrosive gas, and combustible gas, and inclusion of lots of solids or condensable materials.

The range of our responsibility for warranty on this warranty shall be limited to repairs or replacement of defective portions, excluding any loss generated by secondary cause. This warranty shall not be applicable to wearing and maintenance parts.

In case any failure or fault occurs, please inform our business office or Shinshu Plant, CS Section of it at once.
APPLICATION OF THE VACUUM PUMP

* This vacuum pump is intended to get a vacuum source for vacuum exhaust, maintenance of vacuum condition, exhaust of reactive gas and produced gas, and cleanliness in the process room and preliminary room in the manufacturing process for semiconductor devices and liquid crystal display units.

The following 2 basic types are lined up.

# MU100 (Standard Type) is for clean exhaust.

# MU100N (with N₂ purge unit) is for light process such like sputtering, light etching and so on.

However, the above is not applicable to the case where using this vacuum pump has been judged to be usable for a use other than these by a previous arrangement with the user before purchase.

* Please consult us when this pump is used for other processes than the above

*Please use MU100N type (with N₂ purge unit) when exhausting condensable gas such as water vapor.

If MU100 type (standard type) is used for exhausting condensable gas such as water vapor, moisture condensed inside the pump may not be exhausted enough and that may cause pump failure.

* When the use is going to change the process for using this vacuum pump or divert this pump to another use, please consult our business office or Shinshu Plant, Technical Section.

It may be necessary to change the specifications of the pump and peripheral units.

* Using this vacuum pump to uses adopting radiation is prohibited.

(iv)
1. ITEMS RELATED TO SAFETY

1.1 Safety

This instruction manual describes the following items related to safety.

⚠️ **DANGER**

Before completion of electric wiring work, don't supply power in any case; otherwise an electric shock may be caused.

Disconnect power connector before starting maintenance work; otherwise an electric shock may be caused.

⚠️ **WARNING**

When lifting the pump, secure safety by a worker qualified for operating the forklift truck or crane.

Don’t stand under the lifted pump in any case; otherwise injury may be caused by falling.

If any leak exists in the suction/exhaust pipe when toxic gas, corrosive gas or combustible gas is exhausted or sucked, a man-caused accident, fire, or explosion may be caused.

Because the temperatures of the suction and exhaust pipes of the pump become high, arrange them so that they may not come in contact with the human body and combustible materials.

The execution of wiring work is limited to qualified workers.

Be sure to perform grounding, otherwise an electric shock may be caused by electric leak.

While the pump is in operation or for a while after it is stopped, the temperature of the pump is high. Don’t bring the human body or combustible materials into contact with the pump; otherwise a burn may be caused.

When opening the inside of the pump or piping facilities to check if the pump exhaust port is clogged with reaction products, take the following measures as required to secure the safety for workers in consideration of the toxicity or septicity of exhaust gas.

* Purge N₂ gas completely before removing the pump or piping facilities.
* Put on protective clothes, protective gloves, protective glasses, protective mask, etc. as required.
* Perform ventilation enough for the workshop.
* Collect residual materials such as waste oil and dispose of it in a proper way.

The pump keeps high temperature for a while after it stopped. Don't bring the human body or combustible materials into contact with the pump; otherwise a burn may be caused. Confirm the temperature of the pump adequately came down before the work is started.

When inspection and repair by removing the pump package are necessary, please contact us or the designated company by us.
CAUTION

Don't get on the pump or put a thing on it; otherwise falling or turnover may be caused.

Don't move the piled two pumps together in any case; otherwise pumps may be turned over.

When exhausting corrosive gas, combustible gas, etc., adopt high corrosion-resistant materials for pipes and parts used on both suction port and exhaust port sides.

Be sure to close the N₂ gas supply port by a blank plug when N₂ gas is not supplied; otherwise leakage may be caused.

For diluting toxic gas to the safe concentration by means of N₂ gas purging, connect an N₂ gas purge pipe to the exhaust side separately.

CONFIRMATION

Don't pile packed pumps and don't lay each pump on its side in any case; otherwise the damage may be caused to the pumps.

Use a cooling water pipe with a sufficient thickness. If the pipe diameter is small, the required cooling water volume cannot be secured. The pipe diameter should have an allowance in consideration of pressure loss in the piping system. Furthermore, secure a differential pressure of 0.2 MPa or more between the water supply port and drain port in the supply/drain facilities.

Don't use poor-quality water or hard water as cooling water, otherwise clogging may be caused in the cooling water system, leading to an alarm stop due to abnormal heat generation of the pump. Use water that contains "less impurity".

Don't supply the power to other instruments from the pump package and the controller, because that may cause malfunction of the control systems or failure of the pump.

For Input signals (Pin No. 1, 2, 4), apply a voltage of 24V DC on the pump controller side. Don't apply a voltage on the equipment side, otherwise the controller may go wrong.

When the inductive load is opened or closed by output signal, please connect a surge-absorbing element such as diode at both sides of the load. There is a possibility that the internal relay contact may go wrong or noise may be caused.

The pump does not stop upon occurrence of an error of WARNING level. However, if the pump operation is continued in this condition, the pump may stop or go wrong on a sudden.

When draining the cooling water, make sure to introduce the compressed air into the cooling water outlet in order to drain water from the inlet. If the compressed air is introduced into the cooling water inlet, the flow meter may be damaged.

When condensable gas such as water vapor was exhausted by MU100N, please keep it running with N₂ purge for about one hour after completion of the process. There is a possibility of pump failure arising from corrosion or other factors when condensed moisture, etc. remains inside the pump.

When there is a possibility of freezing while the pump is stopping, admit compressed air into the cooling water outlet and drain the cooling water from the inlet, otherwise that may cause the damage on the pipes for cooling water and the water leakage may occur.

<REQUEST>

A pump that used toxic gas has a danger to be invited by residual gas at an overhaul.

When returning the pump, substitute N₂ gas for the inside of the pump completely. And describe necessary items including applied gas in the Return Notice Sheet attached to the end of this manual. Then, sent this sheet to us before returning the pump units.

The items related to safety are also described in the relevant items in this document. Please be sure to read the whole instruction manual.
1.2 Types of Warning Label

The following warning labels are stuck on the main body of the dry vacuum pump to provoke cautions on use. The warning label sticking positions are shown on the next page.

List of Warning Labels Stuck on the Dry Vacuum Pump

Warning label F

Warning label G

Warning label D

Warning label E
2. PRODUCT CONFIRMATION

This dry vacuum pump is delivered after it is strictly inspected and packed. When the user receives the package, open it and confirm the following points.

* Check if its components parts are all included. Check if the pump specifications comply with those of your order.
* Check if any damage has not occurred during transportation. If any fault is found, please inform our business office of it at once.
* Regarding pump accessories, check them according to the packing list separately dispatched.

<Storage of the Pump>

* In case the pump is not installed immediately after it is received, store it in a clean environment in the following conditions:

<table>
<thead>
<tr>
<th>Condition</th>
<th>Specification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Temperature</td>
<td>5 to 40 deg. C</td>
</tr>
<tr>
<td>Humidity</td>
<td>80 % or less</td>
</tr>
</tbody>
</table>

CONFIRMATION

Do not pile packed pumps and do not lay each pump on its side in any case, otherwise the damage may be caused to the pumps.
3. PRODUCT OVERVIEW

There are 2 types in MU100 series.
(1) MU100 ------ Standard Type
(2) MU100N ---- With N2 Purge Unit
Please select type depending on application.

Pumps basically consist of a pumping mechanism, a motor, a N2 module and a cooling water module that are mounted on the base and covered with a package, and a handheld controller.

3.1 Pump Body

* A pair of hybrid roots rotors synchronously rotates, keeping a given clearance, and transfers the gas from inlet port to exhaust port.
* Bearings and gears are installed and lubricated with oil.
* Synchronous motor.
* They are heat up by the compressed gas, the friction at the bearing and at the seals makes pump temperature high, under which the pump is cooled with cooling water.

3.2 Cooling Water System

* The coupler is provided at each of the water supply and drain ports.
* The cooling water supplied from the inlet port travels through oil cooler, casing, motor, and flow meter to drain port.
* Any valve for flow rate control is not built in. Accordingly, it is necessary to install one externally.

3.3 N2 Gas Purge System
(Applicable to MU100N. Not installed on MU100.)

* It is a unit for carrying out a N2 gas purge.
* In this unit, it is branched into an atmosphere side spindle and a vacuum side spindle.
* N2 flow rate is fixed by orifice.
  However, the flow rate can be adjusted by changing supply pressure with the regulator.
* To suck condensative gas or corrosive gas, N2 gas purge is necessary.
  To exhaust light gas such as helium, purging is required with the object of performance improvement.

3.4 Electric System

* Fuse, noise filter, power source for control and control board are housed in the electric panel in the pump package.
* To secure safety, the pump is operated while cooling water value, pump casing temperature and motor coil temperature are monitored.

| Purge N₂ (Note3)                  | Supply Pressure         | ----                             |
|                                   | Setting Pressure        | ----                             |
|                                   | Flow Rate               | ---- 5 SLM at 0.05 MPa G (depending on use) |

**Note 1)** This is a value without purging.
**Note 2)** This does not denote an allowable value of steady voltage, but not an allowable value of variation.
**Note 3)** N₂ gas purge is required to suck corrosive gas.
3.7 Pumping Performance

![Graph of Pumping Performance vs Inlet Pressure (Pa and Torr)]
3.8 System Flow Diagram

Note) ※ (N₂ gas Purge Unit): Applicable to MU100N. Not installed on MU100.
4. INSTALLATION OF THE PUMP

The exhaust performance of the dry vacuum pump is affected by the opening diameter and length of the suction / exhaust pipe and the performance of the installed peripheral units. Moreover, when corrosive gas is exhausted, proper maintenance for each use is required to operate the pump normally for a long time. When the pump is installed, valves and pipes required for maintenance should be installed beforehand to secure higher maintenance efficiency. Adopt pipes and sealing parts in consideration of corrosion resistance.

4.1 Installation

4.1.1 How to install the lifting bracket

Please install the provided lifting brackets in position with the correct direction. (Fig. 4.1)

Please fasten the hexagon bolt properly.

4.1.2 Installation

WARNING

When lifting the pump, secure safety by a worker qualified for operating the forklift truck or crane.

WARNING

Don't stand under the lifted pump in any case, otherwise injury may be cause by falling.

Use a proper wire and a proper crane for lifting the pump, which are suitable for the weight of the pump.

When lifting the pump, make the lifting angle of the wires equal so that the load may not be one-sided. (Fig. 4.2)
CAUTION

Don't get on the pump or put a thing on it; otherwise falling or turnover may be caused.

* Install the pump indoors.
* Install the pump on a solid and level surface of the floor.
* Allow a proper space around the pump so that the pump may be installed and maintained smoothly.
* Be careful not to make the temperature exceed 30 deg. C and not to make the humidity exceed 80% around the pump while it is operating, especially in closed place, because that may cause dew condensation inside the pump.
* Fix the N₂ and cooling water pipes and cables securely.
* Avoid installing the pump in the following places:
  a) Outdoors, a place that may be splashed with water, and a place of extremely high humidity. (A place of 80% or higher humidity is not proper.)
  b) A place where a toxic gas such as acid and alkali gases exists.
  c) A place where an explosive or combustible gas exists.
  d) A dusty place.
* When moving the pump, use the caster provided on the base.
  For preventing the pump from moving and for leveling, use the adjuster provided on the base.
* When fixing the pump, adjust the adjuster so that the 4 casters may float above the floor (approx. 5mm or 10 mm max.) (Fig. 4.3)

![Fig.4.3 Procedure for Adjusting Adjuster](image-url)

* The pump is a heavy material (MU100/100N: 60 kg). To facilitate the maintenance work, install the pump on the floor.
* When moving the pump by pushing it, push it in the longitudinal direction. If the pump is pushed in the transverse direction, it may be overturned.
* When moving pump on the uneven place, please put the pump on the carriage.
* Removing the lifting brackets is possible after installing the pump. Please keep the removed brackets carefully, because they are necessary when piling two pumps.
4.1.3 How to pile pumps

**CAUTION**

Don't move the piled two pumps together in any case; otherwise pumps may be turned over.

* When piling two pumps, please fix them by the adjuster and couple them with the provided lifting brackets. (2 points)(Fig. 4.4)

* Please install the lifting brackets with the correct direction and fix them by hexagon bolt properly.

![Diagram of two pumps piled together](image)

Fig. 4.4  Piling two pumps
4.2 Piping

4.2.1 Vacuum and exhaust piping

Connect a vacuum pipe and an exhaust pipe to the suction port and the exhaust port, respectively. The suction port of the dry pump is an NW50 quick flange, while the exhaust port of this pump is an NW25 quick flange. Perform piping or make connections to different parts by using these flanges.

⚠️ WARNING

If any leak exists in the suction/exhaust pipe when toxic gas, corrosive gas or combustible gas is exhausted or sucked, a man-caused accident, fire, or explosion may be caused.

⚠️ WARNING

Because the temperatures of the suction and exhaust pipes of the pump become high, arrange them so that they may not come in contact with the human body and combustible materials.

⚠️ CAUTION

When exhausting corrosive gas, combustible gas, etc., adopt high corrosion-resistant materials for pipes and parts used on both suction port and exhaust port sides.

* Use clean pipes without any foreign material for piping.
* Don't install a heavy material directly at the suction port and the exhaust port; otherwise a leak or damage will be caused to the connecting portions.
* It is recommended to use a stainless flexible joint between the pump and a pipe.
* Don't stick any dust or foreign material on the flange seal surface or don't give damage to the flange seal surface.
* To keep the exhausted system in a vacuum condition when the pump is stopped, install a vacuum shut-off valve between the pump and the exhausted system.
* If there is a possibility that dust may be absorbed, install a proper scale trap at the first stage of the pump.
* Take it into consideration to allow enough conductance for piping and exhaust gas processing facilities so that the pressure on the exhaust port side (back pressure) of this pump may be 3 kPa or less.
4.2.2 Cooling water piping

* Before operating this pump, be sure to cause cooling water to flow. For connecting the cooling water pipe, use the self-seal type one-touch couplers provided at 2 positions in the lower part of the front side of the pump.
The connecting screw size of the self-seal type one-touch coupler is Rc1/4.
* Install a flow rate control valve outside the pump.
(This control valve is not attached inside the pump.)

<table>
<thead>
<tr>

<th>0.2 to 0.5 MPa</th>
</tr>
</thead>
<tbody>
<tr>
<td>Temperature</td>
<td>5 to 30 deg. C</td>
</tr>
<tr>
<td>Flow rate</td>
<td>2 to 3 L/min</td>
</tr>
</tbody>
</table>

CONFIRMATION

Use a cooling water pipe with a sufficient thickness. If the pipe diameter is small, the required cooling water volume cannot be secured. The pipe diameter should have an allowance in consideration of pressure loss in the piping system. Furthermore, secure a differential pressure of 0.2 MPa or more between the water supply port and drain port in the supply/drain facilities.

CONFIRMATION

Don't use poor-quality water or hard water as cooling water, otherwise clogging will be caused in the cooling water system, leading to an alarm stop due to abnormal heat generation of the pump. Use water that does not contain lots of impurities according to the following table.

Standard Water Quality for Industrial Water Supply
(Japan Industrial Water Works Association, Industrial Water Quality Standardization Committee)

<table>
<thead>
<tr>
<th>Pollution (ppm)</th>
<th>20</th>

</tbody>
</table>
4.2.3 \( \text{N}_2 \) gas purge piping
(Applicable to MU100N. Not installed on MU100)

\( \text{N}_2 \) gas purging is always necessary with the exception of clean gas exhaust. Especially, make sure to purge \( \text{N}_2 \) when exhausting condensable gas such as water vapor. For connecting a \( \text{N}_2 \) gas purge pipe, use the connecting port provided in the lower part of the front side of the pump.

<p>| | |</p>
<table>

<td>0 or 8.3 Pa.m(^3)/s (0 or 5 SLM)*</td>
</tr>
</tbody>
</table>

* The \( \text{N}_2 \) gas purge flow rate depends on each process. (Refer to page 30)

CAUTION

Be sure to close the \( \text{N}_2 \) gas supply port with a blank plug when \( \text{N}_2 \) gas is not supplied; otherwise leakage may be caused.

1) Piping procedure

a) Applicable tube size : 1/4 in.
b) Cut the tube in perpendicular form and eliminate burrs at the end. Take extreme care not to give damage to the external diameter portion.
c) Stop turning for the hexagonal portion on the main body side of the joint with a wrench and remove the existing lock plug with a wrench.
d) Insert the nut and ferrules into the tube until the end of the tube comes to the main body of the joint, and screw the nut by hand until it is locked. (Fig. 4.5)
e) Stop turning for the hexagonal portion of the main body side of the joint and tighten the nut by 1+1/4 turns with a wrench. For retightening the nut which was tightened once, tighten it by 1/4 turn with a wrench from the lock status provided by hand-tightening.

Fig. 4.5  Piping procedure

2) If a pipe is not connected, don’t loosen the existing lock plug.
4.3 Electric Wiring

The earth leakage breaker is not installed on this pump. Be sure to supply power from a power source, which is protected by an earth leakage breaker suitable for the following specifications.

<table>
<thead>
<tr>
<th>Metric</th>
<th>Specification</th>

</tr>
</tbody>
</table>

⚠️ **DANGER**
Before completion of electric wiring work, don't supply power in any case; otherwise an electric shock may be caused.

⚠️ **WARNING**
The execution of wiring work is limited to qualified workers.

**CONFIRMATION**
Don't supply power from the inside of the pump package or the controller to other apparatus; otherwise a malfunction will be caused to the control system or a failure may be caused to the pump.

4.3.1 Power wiring (Connector symbol : CN1, power supply)

⚠️ **WARNING**
Be sure to perform grounding, otherwise an electric shock may be caused by electric leak.

Use wiring materials suitable for the pump power.

</table>

**CONFIRMATION**

For Input signals (Pin No. 1, 2, 4), apply a voltage of 24V DC on the pump controller side. Don't apply a voltage on the equipment side, otherwise the controller may go wrong.

The output signals (pin No. 3-11, 5-13, 6-14, 7-15) are no-voltage relay contact outputs. Apply a voltage of 24 V DC, 1A or less on the equipment side.

**CONFIRMATION**

When the inductive load is opened or closed by output signal, please connect a surge-absorbing element such as diode at the both sides of the load. There is a possibility that the internal relay contact may go wrong or noise may be produced.
5. HANDHELD CONTROLLER

The handheld controller is used to operate and stop the pump in the local mode (the local operation). Connect the handheld controller attachment cable with the connector (CN3) of the rear panel of the pump. The pump operating status and pump data are indicated on the LCD (Liquid Crystal Display) of the handheld controller. The pump operating status can be confirmed by LEDs on the rear panel of the pump body when the handheld controller is removed.

5.1 Controller Functions

Fig. 5.1  LED on the rear panel of the pump body

Fig. 5.2  Appearance of the handheld controller
1) POWER SUPPLY LED (green)
   This LED comes on when the power is supplied to the pump and the main switch is on, and
goes out when the switch is off.

2) RUN LED (green)
   This LED comes on when the dry pump runs and goes out when stops.
   (Regardless of the LOCAL/REMOTE status)

3) ERROR WARNING LED (orange)
   This LED comes on in the ERROR WARNING status. When the WARNING status is
cleared and a rest operation is normally performed, the LED will go out.
   (Regardless of the LOCAL/REMOTE status)

4) ERROR ALARM LED (red)
   This LED comes on in the ERROR ALARM status. When the ALARM status is cleared and
   a rest operation is normally performed, the LED will go out.
   (Regardless of the LOCAL/REMOTE status)

5) LOCAL/REMOTE (local control/remote control) SELECTION SWITCH
   This switch is used to select LOCAL (local control) or REMOTE (remote control). Each time
   this switch is pressed, one of them is selected. When changing REMOTE over to LOCAL, if
   the pump is in operation, the operation will be continued. If the pump is at a stop, the pump
   will remain in the stop status. Changing from LOCAL over to REMOTE is attained in the
   REMOTE input status

6) LOCAL/REMOTE (local control/remote control) DISPLAY LED (green)
   This LED comes on in the LOCAL (local control) status.

7) START SWITCH
   This switch is used to start the pump in the LOCAL (local control) status.
   * Press the switch continuously for 0.5 sec or more.
   (If the switch is pressed for less than 0.5 sec, the RUN command will be canceled.)

8) STOP SWITCH
   This switch is used to stop the pump in the LOCAL (local control) status.

9) ERROR RESET SWITCH
   This switch is used to reset the ERROR WARNING or ALARM status. In the LOCAL (local
   control) mode, the abnormal status can be reset by this switch if the cause of the abnormal
   status has been removed. In the REMOTE (remote control) mode, the function of this
   switch becomes ineffective. Accordingly, for resetting, this switch must be operated in the
   REMOTE input mode.

10) ERROR WARNING/ALARM BUZZER
    This buzzer sounds intermittently in the Warning status and continuously in the Alarm
    status.
    (Regardless of the LOCAL/REMOTE status)
    It sounds briefly only once for confirmation when a switch of the handheld controller is
    pushed, independently of the error status.
11) BUZZER STOP SWITCH
This switch is used to stop the buzzer sounding in the error status. But the error status can not be reset by this switch.
(Regardless of the LOCAL/REMOTE status)

12) LCD (16 digits x 2 lines)
This display indicates
- PRESENT DATA
- WARNING LEVEL
- ALARM LEVEL
- PUMP DATA
- ERROR LIST
- SET DP/SPEED

13) SETTING SWITCH
This switch is used to change the preset value of the ERROR WARNING and the date and time.

14) SCROLL SWITCH
This switch is used to scroll the title indication (▶) and to check its details(▽, ▲). It is also used to change the numerical value and the digit when the preset value of the ERROR WARNING and the date and time are changed.

5.2 Error Levels

In this controller, two levels (ALARM, WARNING) of error mode are set depending on the level of error. Refer to the following Table 5.1.

Table 5.1 Pump Interlock Levels

<table>
<thead>
<tr>
<th>ERROR LEVEL</th>
<th>Pump/Controller operation on detection of error</th>
<th>LED indication</th>
<th>Note</th>
</tr>
</thead>
<tbody>
<tr>
<td>ALARM</td>
<td>Impossible to start</td>
<td>Stop</td>
<td>ALARM LED: Lighting</td>
</tr>
<tr>
<td>WARNING</td>
<td>Impossible to start</td>
<td>Continuation of running</td>
<td>WARNING LED: Lighting</td>
</tr>
</tbody>
</table>

CONFIRMATION

The pump does not stop upon occurrence of an error of WARNING level. However, if the pump operation is continued in this condition, the pump may stop or go wrong on a sudden.
5.3 Details of Indication

Title screen in the handheld controller can be selected by ➤ (See figure 5.3) and the details of each title screen can be checked by ▼ or ▲ .

Fig. 5.3 The Indication of the handheld Controller
5.3.1 PRESENT DATA

The present pump data, the date and total operating hours can be indicated.

LCD screen

To be shifted 1 line by or

To the screen for changing the preset value.

How to change the preset value:
- Make cursor light up on the numeric value in the first line of LCD screen.
- Move the cursor.
- Push to finish changing the preset value.
- Push to go back to the prior screen without the change of the preset value.

Go back to the prior screen after the preset value is changed.
Go back to the prior screen without the change of preset value.

Same methods as changing the date.

Note) "#" Indicates the present pump data.
Note) "OPT" is optional setting. It is not indicated when the option is not being installed.
Note) ※: N₂ gas flow rate is indicated only for MU100N. Not indicated for MU100.
5.3.2. WARNING LEVEL

The preset value for WARNING can be indicated and changed. In case of Warning, the controller gives the warning sign but pump does not stop.

LCD screen

The factory preset value

<p>| | | | |</p>
<table>
<thead>
<tr>

<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Note 1) Change of a WARNING LEVEL cannot be performed while the pump is in operation. Please carry out after stopping a pump.

Note 2) Change of a WARNING LEVEL cannot be performed in "REMOTE" mode. Please carry out after changed into "LOCAL" mode.

Note 3) If the value for Warning is set more sensitively than for Alarm, Warning can not be detected.

Note 4) It is possible to prevent the warning sign by setting the Warning level at [0.0].

Note 5) ※: N2 warning level can be set up only for MU100N. Not indicated for MU100.

Note 6) "OPT" is optional setting. It is not indicated when the option is not being installed.
5.3.3. ALARM LEVEL

The preset value for ALARM can be indicated. In case of Alarm, pump stops with the alarm sign.

LCD screen

The factory preset value

<table>
<thead>
<tr>
<th>OPT</th>
<th>MU100 / 100N</th>
</tr>
</thead>
<tbody>
<tr>
<td>DP / WATER</td>

</tr>
<tr>
<td>Minimum rotation speed</td>
<td>2000 rpm</td>
<td></td>
</tr>
</tbody>
</table>

Note 1) Change of rotation speed cannot be performed in "REMOTE" mode. Please carry out after changed into "LOCAL" mode.

Note 2) The character of "TuningSPD" blinks to the LCD display part when the pump rotation speed is changed.

Note 3) The performance of the pump will change if the rotation speed is changed. Please contact us about the pump performance in the case of changing the rotation speed.

Note 4) Please contact us if the changed rotation speed is requested to be memorized and become effective when the power is turned on again.
6. OPERATION AND STOP

6.1 Preparations for Operation

1) Check if electric wiring is correctly and securely performed.
2) Check if the suction pipe and the exhaust pipe are securely connected. When a valve is installed on the exhaust side, open the valve securely before starting the pump.
3) Cause cooling water to flow at a flow rate of 2 to 3 L/min. Check if any water leak does not occur.
4) Adjuster and operate the N₂ gas purge flow rate according to the following method. (N₂ purge unit is installed only on MU100N. Not installed on MU100.)

---

**CAUTION**

For diluting toxic gas to the safe concentration by means of N₂ purging, connect an N₂ purge pipe to the exhaust side separately.

---

**CAUTION**

Be sure to close the N₂ gas supply port by a blank plug when N₂ gas is not supplied; otherwise leakage may be caused.

---

a. N₂ purge mode
(Applicable to MU100N. Not installed on MU100.)

The standard N₂ purge flow rate is shown in the following table. Note that the N₂ purge flow rate depends on each applied process.

<table>
<thead>
<tr>
<th>Mode of N₂ purge</th>
<th>Supply port</th>
<th>N₂ flow rate Pa*m³/s (SLM)</th>
<th>Caution</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mode of no-purge</td>
<td>Seal with a blank plug</td>
<td>0</td>
<td>At the mode of no-purge, be sure to seal the N₂ supply port with a blank plug.</td>
</tr>
<tr>
<td>Mode of spindle purge</td>
<td>Setting pressure 0.04 to 0.07 MPa</td>
<td>8.3 (fixed) (approx. 5)</td>
<td>The flow rate for the spindle purge is fixed by the built-in orifice, but varies with each pressure. (Approx. 8.3 Pa*m³/s (approx. 5 SLM) at 0.05 MPa)</td>
</tr>
</tbody>
</table>

b. Suggested N₂ purge flow rate
(Applicable to MU100N. Not installed on MU100.)

The standard N₂ purge flow rate is shown in the following table. Set up the N₂ purge flow rate depends on each applied process.

<table>
<thead>
<tr>
<th>Setting pressure (MPa)</th>
<th>Standard flow rate Pa*m³/s (SLM)</th>
</tr>
</thead>
<tbody>
<tr>
<td>0.04 to 0.07</td>
<td>Exhaust to the air</td>
</tr>
<tr>
<td>Mode of N₂ purge</td>
<td>Mode of no-purge</td>
</tr>
<tr>
<td>8.3 (5)</td>
<td>Mode of spindle purge (Note 2)</td>
</tr>
</tbody>
</table>

Note 1: Light process : Spattering, Light Etching, etc.
Note 2: The flow rate for spindle purge is fixed by the built-in orifice, but varies with each pressure. (Approx. 8.3 Pa*m³/s (approx. 5 SLM) at 0.05 MPa)
6.2 Operation

6.2.1 Local (local control) operation

1) Supply power to the pump.
2) Switch on the MAIN POWER switch of the pump. At the time, POW LED on the pump will come on.
3) Select "LOCAL" by the REMOTE/LOCAL selection switch on the handheld controller. (The LOCAL LED on the handheld controller will come on.)
4) Push the START switch on the handheld controller continuously for 0.5 seconds or more.
5) The pump will be started and the START LED on the handheld controller and the RUN LED on the pump will come on. At the time, the PUMP RUN/STOP Status signal will be put into a make state. (Closing Pin 3-11)

* When the pump is operated by cold starting, the performance at steady operation cannot be obtained at the ultimate pressure and the exhaust speed for about one hour after it is started. When causing condensative gas or corrosive gas to flow, operate the pump for about one hour after starting it, and then exhaust the corresponding gas after the pump temperature rises.

6.2.2 Remote (remote control) operation

1) Check the power is supplied to the pump and the MAIN POWER switch of the pump is ON.
2) Select "REMOTE" by the REMOTE/LOCAL selection switch on the handheld controller. (The LOCAL LED on the handheld controller will go out.)
3) Input the PUMP RUN signal from the remote control connector (CN2). (Closing Pin 1-9) (For the details of input/output signals, refer to 4.3.2 Control wiring. (Page 18))
4) The pump will be started and the START LED on the handheld controller and the RUN LED on the pump will come on. At the time, the PUMP RUN/STOP Status signal will be put into a make state. (Closing Pin 3-11)

6.2.3 Low Speed operation (Effective only in remote operation)

1) Check the power is supplied to the pump and the MAIN POWER switch of the pump is ON.
2) Input the PUMP RUN signal from the remote control connector (CN2) in REMOTE mode to start the pump. (Closing Pin 1-9)
3) Input the LOW SPEED signal from the remote control connector (CN2). (Closing Pin 2-10) (Note 1)
4) The pump will operate at the preset rotation speed for LOW SPEED. (Note 2)

(Note 1) The status of LOW SPEED operation continues even if REMOTE mode is changed to LOCAL mode. If LOW SPEED operation is requested to be cancelled in LOCAL mode, please stop the pump and start it again, and the pump can run at the rated rotation speed.
(Note 2) The preset rotation speed for LOW SPEED is 66.7 Hz (4000rpm) when being shipped from our plant. The rotation speed can be changed from 33.3 Hz to 113.3 Hz (2000 - 6800 rpm). However, please consult us when changing the preset rotation speed for LOW SPEED is necessary.

6.3 Stop

**WARNING**

While the pump is in operation or for a while after it is stopped, the temperature of the pump is high. Don't bring the human body or combustible materials into contact with the pump, otherwise a burn may be caused.
When condensable gas such as water vapor was exhausted by MU100N, please keep it running with N2 purge for about one hour after completion of the process. There is a possibility of pump failure arising from corrosion or other factors when condensed moisture, etc. remains inside the pump.

When there is a possibility of freezing while the pump is stopping, admit compressed air into the cooling water outlet and drain the cooling water from the inlet, otherwise that may cause the damage on the pipes for cooling water and the water leakage may occur. (Refer to Page 35 7-3 Section 4 about how to drain the cooling water.)

* Close the cut-off valve on the suction port side of the pump as required. (To keep the inside of the exhausted system in a vacuum in the pump stop status, it is necessary install a vacuum shut-off valve between the exhausted system and the pump and then close this valve before the pump is stopped.)
* When condensable gas such as water vapor or process gas has been exhausted by MU100N, operate the pump continuing N2 gas purge for about one hour after completion of the process, and then stop the pump. Continue this N2 gas purge for several minutes in this condition and then stop the supply. This is intended to prevent exhausted different types of gas from staying in the pump by substituting N2 gas for the inside of the pump with the object of avoiding corroding the inside. As the quantity of exhausted gas and products produced by reaction increases, perform N2 gas purging for a longer time.
* If there is an open/close valve on the exhaust port side of the pump, close this valve. If such a valve is not available, continue N2 gas purging even when the pump stops, or performing sealing with a blank flange to prevent air or process gas from entering from the exhaust port.
* After the pump stops, cause cooling water to flow continuously for about one hour.

6.3.1 Local (local control) stop

1) Push the STOP switch on the handheld controller.
2) The pump operation will stop and the START LED on the handheld controller and the RUN LED on the pump will go out.
   The PUMP RUN/STOP Status signal will be put into an open state. (Opening Pin 3-11)

6.3.2 Remote (remote control) stop

1) Put the PUMP RUN contact of the remote control connector (CN2) into an open state.
   (Opening Pin 1-9)
2) The pump operation will stop and the START LED on the handheld controller and the RUN LED on the pump will go out.
   The PUMP RUN/STOP Status signal will be put into an open state. (Opening Pin 3-11)

6.4 Operation upon Occurrence of Momentary Power Interruption

When momentary electronic power failure occurs while the pump is running, power supply will stop. However, the control system holds the status before the momentary electronic power failure for a while.

The system holds the status before the power failure for about 0.4 seconds.

Reaction after the power recovery

In case that power failure is less than 0.4 seconds : Continuation of operation
In case that power failure is over 0.4 seconds : Go back to the state which have supplied power. (Standby status)
7. MAINTENANCE

7.1 Maintenance Method

⚠️ WARNING

When opening the inside of the pump or piping facilities to check if the pump exhaust port is clogged with reaction products, take the following measures as required to secure the safety for workers in consideration of the toxicity or septicity of exhaust gas.

* Purge N₂ gas completely before removing the pump or piping facilities.
* Put on protective clothes, protective gloves, protective glasses, protective mask, etc. as required.
* Perform ventilation enough for the workshop.
* Collect residual materials such as waste oil and dispose of it in a proper way.

In order to the safe operation of this pump and maintain its performance for a long time, take the following points into consideration.

a) Operate the pump within the range described in the catalog and the instruction manual.
b) Perform inspection as specified in the maintenance standard.
c) For disassembly and inspection or overhaul, return your product to Kashiyama Industry Co., Ltd. or a dealer approved by us.
   Please consult with our business office or Shinshu Plant, CS Section beforehand. Perform an overhaul once every year. However, when the gas to be absorbed is very reactive or corrosive, it may be necessary to perform an overhaul within one year.

<REQUEST>

A pump that used toxic gas has a danger to be invited by residual gas at an overhaul. When returning the pump, substitute N₂ gas for the inside of the pump completely and seal the suction port and exhaust port with blank flanges. Also, describe necessary items including applied gas in the Return Notice Sheet attached to the end of this manual. Then, sent this sheet to us before returning the pump units.

We may not undertake an overhaul of pumps that absorbed arsenic gas or phosphorous gas. Please consult with our business office or Shinshu Plant, CS Section beforehand.

d) In case of products of special specifications, the maintenance period and method may be different. Please ask us for information.

e) When the pump must be stopped for a long time for reasons of holidays or the like, stop the pump and perform N₂ purging completely. Then, seal the suction port and exhaust port of the pump with blank flanges at once.
   (This is intended to prevent process gas or air from entering the inside of the pump.)

f) When the pump must be stopped for the sake of maintenance of exhaust gas processing facilities, check if the exhaust port of the pump is not clogged with products. If lots of products are stuck at the port, replace or clean the piping parts.

Regarding repairing service, please ask your nearest business office or Shinshu Plant for information.

*"(O.H)" denotes an item to be executed at last at an overhaul. Note) Perform an overhaul every year.*
7.3 Removal of the Pump

⚠️ DANGER ⚠️
Before completion of electric wiring work, don’t supply power in any case; otherwise an electric shock will be caused.

⚠️ WARNING ⚠️
* The execution of wiring work is limited to qualified workers.
* When lifting the pump, secure safety by a worker qualified for operating the forklift truck or crane.
* Don’t stand under the lifted pump in any case; otherwise injury will be caused by falling.
* The pump is at a high temperature for a while after it is stopped. Avoid bringing the human body or combustible materials into contact with it. If not, a burn may be caused. After confirming that the pump has been cooled completely, perform the work.

CONFIRMATION
When draining the cooling water, make sure to introduce the compressed air into the cooling water outlet in order to drain water from the inlet. If the compressed air is introduced into the cooling water inlet, the flow meter may be damaged.

For removing the used pump, observe the following procedure.

1) Stop the pump and substitute N₂ gas for the inside of the pump completely.
2) Stop supplying power and disconnect the power connector and control connector.
3) Stop supplying N₂ gas and remove the pipe, and then seal the purge gas supply port. (Applicable to MU100N. Not installed on MU100.)
4) Stop cooling water, admit compressed air into cooling water outlet and drain the cooling water from inlet, and then remove the pipe with the one-touch coupler. (Refer to the following drawing for the piping system.)

The piping system at the time of operation

The piping system at the time of draining.

5) Remove the suction pipe and the exhaust pipe, and seal the suction port and the exhaust port with blank flange.
6) Packing
7) When loading the pump or unloading, lift the pump by using upper lifting brackets. (Refer to page 12)
8. TROUBLESHOOTING

⚠️ DANGER
Before completion of electric wiring work, don’t supply power in any case; otherwise an electric shock will be caused.

⚠️ DANGER
Disconnect power connector before starting maintenance work; otherwise an electric shock may be caused.

⚠️ WARNING
The execution of wiring work is limited to qualified workers.

⚠️ WARNING
While the pump is in operation or for a while after it is stopped, the temperature of the pump is high. Don’t bring the human body or combustible materials into contact with the pump; otherwise a burn may be caused.

⚠️ WARNING
When the pump needs to be overhauled or disassembled, with the pump package removed, consult with our sales department or our designated service center.

⚠️ WARNING
When opening the inside of the pump or piping facilities to check if the pump exhaust port is clogged with reaction products, take the following measures as required to secure the safety for workers in consideration of the toxicity or septicity of exhaust gas.
* Purge N₂ gas completely before removing the pump or piping facilities.
* Put on protective clothes, protective gloves, protective glasses, protective mask, etc. as required.
* Perform ventilation enough for the workshop.
* Collect residual materials such as waste oil and dispose of it in a proper way.

# 8.2 Pump Malfunction

Reset the pump after corrective measures below have been taken. In case the cause should remain in breaker trip, the pump cannot be reset. When start signal is input while in remote operation, reset the pump after turning off the external signal as the pump runs on being reset. When the pump needs to be overhauled or disassembled, with the pump package removed, consult with our sales department or our designated service center.

**9. SCRAPPING METHOD**

The pump main body and peripheral units may have been polluted by hazardous substances depending on each applied process. Perform scrapping in compliance with the safety control standards of the nation and each local self-governing body.
10. PRECAUTIONS ON RETURN OF PRODUCT

10.1 Special Noteworthy Matter

When returning the pump and peripheral units to us for an overhaul, repair, etc. be sure to clarify the applied gas and products. This is duty-bound by the Industrial Safety and Health Law.

Before returning a unit, fill the Return Notice Sheet attached to this manual with necessary contents and submit it by FAX or mail. The user may have to return it to the approved dealer depending on the applied gas. The above request will lead to a smooth repair or overhaul.

If this sheet is not submitted, the returned product may be regarded as a hazardous substance and be rejected.

10.2 Returning Procedure

**CONFIRMATION**

When draining the cooling water, make sure to introduce the compressed air into the cooling water outlet in order to drain water from the inlet. If the compressed air is introduced into the cooling water inlet, the flow meter may be damaged.

**CONFIRMATION**

When there is a possibility of freezing while the pump is stopping, admit compressed air into the cooling water outlet and drain the cooling water from the inlet; otherwise that may cause the damage on the pipes for cooling water and the water leakage may occur.

For a return, observe the following procedure.

1) Copy the Return Notice Sheet attached at the end of this manual and fill it with necessary contents.
2) Operate the pump while charging inert gas such as N₂ gas to remove toxic gas and corrosive gas completely from the pump. For the peripheral unit to be returned, eliminate toxic gas by charging inert gas. When solutions and lubricating oil can be disposed of properly on the user side, bleed them completely.
3) Admit compressed air into the cooling water line to drain the cooling water from the pump and remove all the accessories from the unit.
   (Refer to Page 35 7-3 Section 4 about how to drain the cooling water.)
4) Seal up the suction port and exhaust port of the pump by using blank flanges.
5) Seal up the product to be returned if possible after putting them in a polyethylene case or polyethylene sheet.
6) When returning the pump or unit, put the product to be returned on a wood pallet with a size of 510 mm x 915 mm or less and fix it with bands. In case of a large product which cannot be put on such a pallet, please ask us for information.
7) If the product to be returned is not so large as being fixed on a pallet, pack it in a solid case.
8) If the product to be returned is polluted, observe the law related to the transportation of hazardous substances, and stick a label having an indication to this effect on a pallet or case.
9) Submit the Return Notice Sheet filled with necessary contents to us by FAX or mail. This Return Notice Sheet should reach us earlier than the product to be returned.
10) Hand over a copy of the Return Notice Sheet to the forwarding agent. If the product to be returned is polluted, be sure to inform the forwarding agent of this effect.
11) Put the original of the Return Notice Sheet into an envelope and stick it on the outside of the product to be returned.
Return Notice Sheet

Date: ____________

I. Product to be returned
   i) Model No. of the product to be returned
      ________________________________
   ii) Serial No. of the product to be returned
