## **1. ABSTRACT**

Several theodolite measurement systems are available for use in the industrial metrology market. Many of them offer a rigorous 3-dimensional bundle adjustment routine. In this paper several systems in use and available for evaluation purposes at the Stanford Linear Accelerator Center will be tested and their results compared.

## **2. INTRODUCTION**

Since 1986 theodolite based industrial measurement systems have become an essential tool in the survey and alignment work done at the Stanford Linear Accelerator Center (SLAC). Due to the precision and accuracy required for today's particle accelerator alignment, industrial measurement system techniques have replaced or complimented many of our traditional optical tooling methods. We first used the KERN ECDS-PC system and later our own SLAC Industrial Measurement System (SIMS) to perform everything from magnet fiducialization<sup>1</sup> to mapping of entire beamlines. The greatest advantage of an industrial measurement system is the speed and accuracy in which 3-dimensional coordinates can be generated using redundant data. The core of an industrial measurement system is a 3-dimensional bundle adjustment routine. It is the comparison of these bundle adjustment routines that this paper will concentrate on. Table 1 is a list of the five industrial measurement systems made available for evaluation.

System	Manufacturer
1. AIMS III -- Automated Industrial Measurement System <i>version 2.0B</i>	Cubic Precision / K&E
2. BETS -- Brunson Electronic Triangulation System <i>version 6.2</i>	Brunson
3. ECDS3 -- Electronic Coordinate Determination System <i>version 3.04</i>	Leica / KERN
4. MANCAT -- MANual Coordinate Analyzing Theodolite system <i>version 2.2</i>	Leica / WILD
5. SIMS -- SLAC Industrial Measurement System <i>version 2.0</i>	SLAC

*Table 1 A list of the bundle routines used in the comparison*

Although each of these systems utilizes a different approach, each has the same goal: precise, accurate and timely 3-dimensional position data.

## **3. MEASUREMENTS**

Each industrial measurement system evaluated is capable of recording directions from a variety of electronic theodolites. To insure that any differences in the bundle results were not caused by the use of different measurement data, one set of measurement data was used for all bundle reductions in each comparison. Each system allows the input of angular observations not directly recorded from a theodolite. Therefore it was possible to input the same angular observations, either by hand, or using a file, for each system.

Initially, several data sets from past surveys done at SLAC were used and the results compared. The comparisons from data set to data set were consistent. We chose one data set for this paper. The data set selected was a magnet fiducialization for a superconducting triplet magnet done at SLAC for the SLD (SLAC Large Detector) project.

---

<sup>1</sup>Fiducialization - Relating the effective electromagnetic axes of components to some kind of marks or fiducials (e.g. tooling balls), that can be touched by instruments.

### 3.1. OVERVIEW

Superconducting triplets are located on both the north and south ends of the SLD detector. The triplets provide the final focusing of the electron and positron beams to micron size before collision of the two beams inside the detector. A superconducting triplet consists of three quadrupole magnets enclosed in a stainless steel cylinder with an approximate diameter of 13 inches and an approximate length of 182 inches. To make the quadrupoles superconducting they are sealed into the triplet cylinder and surrounded by layers of liquid Helium and Liquid Nitrogen to keep the temperature near absolute zero (0 degrees Kelvin, -273 degrees Celsius).

The task of fiducializing the triplets involved establishing a reference using the stainless steel triplet cylinder. After measuring the triplet a cylinder was fit though five rings machined into the stainless steel cylinder, see figure 2. The center line of the cylinder defined beamline and consequently the magnetic centers of the three quadrupole magnets were aligned to the established line. The data set used in the comparison was from one of these fiducialization measurements.

### 3.2. OBSERVATIONS

The measurements consisted of one set of observations (direct and reverse) to the triplet fiducials, tie points, and to a scale bar using KERN E2 theodolites. The mean of these direct and reverse observations were calculated and used in the evaluation of each bundle. Although each of the systems handles direct and reverse observations, for consistency, the mean was taken before the observations were input.

There were 6 theodolite positions and 51 object points used with a total of 191 angle observation pairs (horizontal and vertical angle = 1 pair). One 2 meter scale bar was used to scale the coordinate system. Figure 1 is a diagram of the theodolite positions (1 to 6) and the angles observed in the data set used for the bundle comparisons.

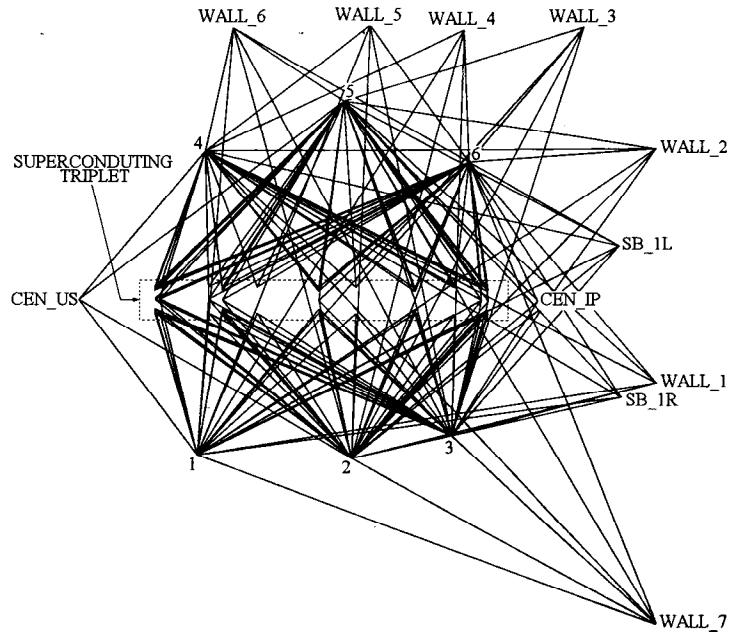

Figure 1 Plan view of the superconducting triplet fiducialization measurements

Figure 2 shows an enlarged view of the superconducting triplet with the names and locations of the fiducials measured.

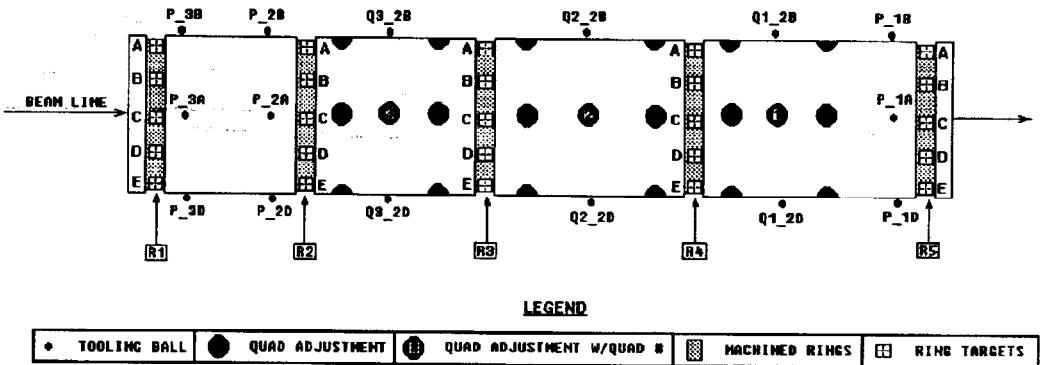

Figure 2 Plan view of the superconducting triplet showing fiducial points

### 3.3. ORIENTATION

Each system handles the task of initially orienting the theodolites in reference to each other differently. The orientation is important because the approximate coordinates for the bundle routines are dependent on the orientation. Since the triplet data was measured using SIMS some adjustments had to be made to the observations in order to be compatible with the other industrial measurement systems. A description of the adjustments made and the systems affected follows.

#### 3.3.1. COLLIMATIONS

The AIMS III, BETS and MANCAT systems utilize collimations between two base theodolites to calculate approximate coordinates for the bundle routine. Although in using the bundle routines these collimations need only be approximate, there were no collimations measured during the triplet survey. To overcome this problem the results from the SIMS bundle were used to calculate the collimation angles for the base pair of theodolites used in the AIMS III, BETS and MANCAT systems. The ECDS3 system uses the same initialization procedures as SIMS so no adjustment was necessary.

#### 3.3.2. HORIZONTAL CIRCLE ORIENTATION

When collimating the base theodolites the BETS system sets the horizontal angle of theodolites 1 and 2 to zero. Any other theodolites used are not required to be oriented. To provide this condition the angles for the theodolites 1 and 2 were rotated by a calculated amount in order to set the zero mark of the horizontal circle to the proper orientation. ECDS3 and SIMS also need the zero mark on the theodolites to be oriented. For these systems all the theodolites are zeroed approximately parallel to the X axis of the object being measured. Since the triplet was measured using SIMS and since the ECDS3 system uses the same approach no correction was necessary. The AIMS III and MANCAT systems do not require the zero mark on the horizontal circle to be in any particular orientation.

## **4. RESULTS**

After orienting and inputting the observations for each industrial measurement system the bundle adjustments were executed. All the adjustments were done in a right handed system with the positive Z axis pointing up and using millimeters and gons as the length and angular units. In order to ensure that the results were easy to compare and not influenced by anything but the observations, the datum was only minimally constrained. The datum was defined by fixing all three coordinates of one point, Y and Z of a second and Z of a third. The distance for the scale bar was the seventh and last fixed parameter needed for the bundles. Table 2 lists the point names and the values of the parameters held fixed in all the bundle adjustments.

Point Name	X (mm)		Y (mm)		Z (mm)	
WALL_1	6612.100	Unknown	-1071.385	Unknown	1672.126	Fixed
WALL_4	4070.170	Unknown	3563.230	Fixed	501.739	Fixed
WALL_6	1021.850	Fixed	3581.824	Fixed	1069.253	Fixed
SCALE (SB_1L to SB_1R)		2000.000 mm				

*Table 2 List of fixed parameters used in the bundle adjustments*

The BETS bundle adjustment routine will only handle 20 points, so a subset of points was taken and used for the bundle adjustment. The coordinates for all the other point were calculated in the on-line data capture mode. By adjusting only 20 points and transforming the rest into the established coordinate system the significance of the statistical data might be reduced. Brunson is currently upgrading the BETS bundle to handle more points. The AIMS III bundle adjustment also limits the number of points to less than we desired. However, Cubic Precision provided us with a beta copy of their next version which does not limit the number of points.

### **4.1. COORDINATE COMPARISON**

The coordinate comparisons were done by using one set of results as the benchmark and then taking the difference between the benchmark and the other sets of results. Since the SIMS results already existed they were used as the benchmark for the comparisons. Table 3 is a sample of the coordinate differences between systems.

<b>AIMS III - SIMS</b>				<b>BETS - SIMS</b>

Table 3 Bundle output coordinate comparisons using SIMS output as benchmark

#### 4.2. SCALE AND ORIENTATION COMPARISON

Along with the coordinate comparisons a seven parameter transformation was done to compare the orientation and scale of the bundle output for each system. Again, as in the coordinate comparisons, the SIMS bundle output was used as the benchmark. The benchmark data was held fixed and the other data sets were transformed into the benchmark system. Table 4 shows the results of the seven parameter transformations.

	AIMS III -SIMS	BETS - SIMS	ECDS3 - SIMS	MANCAT -SIMS
X shift (mm)	-0.0350	-0.0705	-0.0004	-0.0039

Table 4 Bundle output seven parameter results

#### 4.3. STATISTICS COMPARISON

The comparison of the provided statistical information was not as straight forward as the comparison of the coordinates. The bundle routines use two different methods of representing the statistics, standard errors and root mean square errors. Figures 3 and 4 describe the two methods.

$$\text{RMS} = \sqrt{\frac{e_1^2 + e_2^2 + \dots e_n^2}{n}}$$

Where

n = number of observations

e<sub>i</sub> = 3D perpendicular distance from observation vector to point

Figure 3 Root mean square errors

$$\sigma_x = \sigma_0 \sqrt{V_x}$$

Where

$$\sigma_0 = \sqrt{\frac{\mathbf{v}^T \mathbf{W} \mathbf{v}}{r}} = \text{reference standard error}$$

r = degrees of freedom

$\mathbf{v}$  = observation residual matrix

$\mathbf{W}$  = weight matrix

$V_x$  = diagonal term from inversed normal matrix  $\mathbf{N}^{-1}$

Figure 4 Standard errors

The RMS error, being a single value, does not represent a 3-dimensional error very well. The standard errors representing the error components in each coordinate axis individually is a much better way of representing a 3-dimensional error. None of the bundle adjustment routines compared used both. Although these two approaches are not directly comparable an attempt was made to link the two by calculating the RMS errors for the SIMS results. Unlike the other two comparisons, coordinate and scale, the statistical values shown in tables 5 and 6 are the values produced by the bundle adjustments.

BETS *				MANCAT			SIMS

#### 4.4. SYSTEM PROPERTIES

Each of the compared 3-dimensional bundle routines offers a different approach to obtain 3-dimensional coordinates. Tables 7 and 8 list features and size limitations.

	All theo's assumed level to gravity	Approximate collimation required for initial theo orientation	Collimations as an observation	Type of statistics	Error ellipses	Allows weighting of angle observations	Additional observations allowed
AIMS III	YES	YES	NO	RMS	NO	NO	NONE
BETS	YES	YES	NO	SD	NO	NO	NONE
ECDS3	NO	NO	NO	RMS	YES *	NO	NONE
MANCAT	NO	YES	YES	SD	NO	YES	NONE
SIMS	NO	NO	YES	SD	YES	YES	Distances from station to point and leveled height differences

\* ECDS3 calculates error ellipses but they can only be viewed on the screen in simulation mode

*Table 7 Industrial measurement system properties*

	# of points in bundle	# of theo's in bundle
AIMS III	limit extended memory and then hard disk space	8
BETS	limit 20 points + scale bar *	10
ECDS3	limit extended memory	99
MANCAT	limit hard disk space	14
SIMS	limit extended memory	50

\* The BETS bundle is currently being upgraded to handle more points

*Table 8 Bundle size limitations*

#### 5. CONCLUSION

All five systems supply valid 3-dimensional coordinate sets. Although each package has a somewhat different approach the results are comparable. However, as expected the results do not agree completely and we believe some effort will be necessary to standardize in some way the coordinate and statistic presentation. We would like to repeat this comparison later next year to take advantage of any new systems available and of the upgrades taking place in the systems already compared.

#### 6. ACKNOWLEDGMENTS

We wish to acknowledge the cooperation by Brunson, Cubic Precision and Leica. All three manufacturers made their systems freely available for the evaluations. We thank them for their assistance in making this comparison possible.
