

XVIII International Linac Conference Geneva, Switzerland 26-30 August, 1996

CERN/PS 96-32 (DI)

Compendium of Scientific Linacs

J. Clendenin*, L. Rinolfi, K. Takata**, D.J. Warner

*SLAC, Stanford, USA **KEK, Tsukuba, Japan

CERN – PS Division European Organization for Nuclear Research Switzerland November 1996

Foreword

The International Committee supported the proposal of the Chairman of the XVIII International Linac Conference to issue a new Compendium of linear accelerators. The last one was published in 1976. The Local Organizing Committee of Linac96 decided to set up a sub-committee for this purpose.

Contrary to the catalogues of the High Energy Accelerators which compile accelerators with energies above 1 GeV, we have not defined a specific limit in energy. Microtrons and cyclotrons are not in this compendium. Also data from thousands of medical and industrial linacs has not been collected. Therefore, only scientific linacs are listed in the present compendium.

Each linac found in our research and involved in a physics context was considered. It could be used, for example, either as an injector for high energy accelerators, or in nuclear physics, material physics, free electron lasers or synchrotron light machines.

Linear accelerators are developed in three continents only : America, Asia, Europe. This geographical distribution is kept as a basis.

The compendium contains the parameters and status of scientific linacs. Most of these linacs are operational. However, many facilities under construction or design studies are also included. A special mention has been made at the end for the studies of future linear colliders.

In spite of all the care we took to compile all world linacs existing or under development, some are probably missing. The reason is either a lack of information or the fact that no answer was received from the institute.

Many thanks to all persons in the various laboratories who supplied the data about their linacs. We hope that this Compendium will be a useful tool for the Linac community.

L. Rinolfi

Committee and Contributors for the 1996 Compendium

The members of the sub-committee who produced this Compendium are the following :

J. Clendenin (SLAC) L. Rinolfi (CERN) - Chairman K. Takata (KEK) D.J. Warner (CERN)

Y. Yamazaki (KEK) contributed by collecting data from Asian linacs and made useful comments.

S.L. Neboux provided great help using the WWW to obtain information about various linacs and organizing the secretariat. Last but not least, she installed and updated the Compendium on the World-Wide Web.

E. Bryant, T. Kehrer and A. Rogerson have handled the secretarial work in an efficient and enthusiastic way. The clarity of the typing and the efficiency to correct the mistakes have been appreciated. During the elaboration of the Compendium, they kept smiling and that participated to its success.

H. Haseroth, Chairman of the International Committee, proposed the compilation of a Compendium of linacs for this conference.

D. Dekkers, Chairman of the Local Organizing Committee and B. Allardyce made useful comments to finalize the catalogue.

Summary

This compendium comprises 176 scientific linacs distributed over 3 continents :

| Americas | : | 61 |
|----------|---|----|
| Asia | : | 37 |
| Europe | : | 78 |

Altogether the breakdown for the types of particles is the following :

| Electrons | : | 111 |
|------------------------|---|-----|
| Positrons | : | 12 |
| Protons/H ⁻ | : | 23 |
| Ions | : | 30 |

The lists, without technical details, are published on the World-Wide Web. The address is the following :

http://www.cern.ch/Linac96/Linacs.html

- * Lawrence Livermore National Laboratory
- (1) Thermionic (BaO in W matrix), modified Pierce geometry.
- (2) The LLNL 100 MeV Linac is designed to operate in both a short and a long pulse mode depending on whether the application requires a narrow pulse width (eg. for time-of-flight applications) or high average flux. Typical applications include materials irradiation and generation of secondary positron and neutron beams. Typical short-pulse mode parameters are 1-20 ns pulse width, 10 A peak current, and variable repetition rate from single pulse up to 1440 Hz. Long pulse parameters are 1-3 μs, 0.7 A peak, and variable rep rate from single pulse to 300 Hz. Parameters are listed by short-pulse mode / long-pulse mode.
- (3) S-band tapered phase velocity buncher.
- (4) Measured to end of TW section # 5.
- (5) Maximum beam intensity values are given for operation at 75 MeV. For 165 MeV operation design beam intensity values are 2 A / 0.1 A for short / long pulse modes.

ETA II is a linear induction accelerator

- 60 induction cells
- 6.6 cm pipe radius

Nominal beam parameters

- 6.3 MeV plus or minus 2 % beam energy spread
- 2 to 3 kA beam current
- 70 ns pulse width with 30 ns flat top
- 350 π mm-mrad for 1 σ normalized emittance
- plus or minus 1 mm transverse sweep

OTHER RELEVANT INFORMATION

Linac Operating modes: C= collider, FT= fixed target, I=injector for B factory.

- (1) Types: Polarized (P) using a GaAs photocathode. and thermionic (T). At the end of the linac, the e^{-} polarization is typically 80% for C; 85% for FT. Polarized beams not required for I.
- (2) Beam intensity (peak): 8×10^{10} e^{-/} bunch $\times 2$ bunches / rf-pulse for C and $\times 1$ for I; up to 8×10^8 e'/ bunch × 7000 bunches / rf-pulse for FT at up to 30 GeV final energy; and up to 8×10^9 e^{-/} bunch × 700 for FT at up to 50 GeV. B Factory will use only 1 collider type bunch per rf pulse regardless of whether e^{-} or e^{+} .
- (3) Normalized emittance (1σ) : <100 π mm-mrad for T; ~ 10π mm-mrad for P.
- (4) Two 16th subharmonic bunchers and one 2.8 GHz buncher.
- (5) Output: 1200 MeV into Damping Ring (DR) for C and I; straight into linac for FT. At 1200 MeV there are two DRs, one for damping up to $2 e^{-}$ bunches each for 1-interpulse period and a second for damping up to 2 e⁺ bunches each for 2-interpulse periods. The resulting transverse emittance out of either DR can be either symmetric at $\sim 16\pi$ mm-mrad each plane for round beams, or asymmetric at ~ $30(3)\pi$ mm-mrad for the x(y)-plane respectively.

OTHER RELEVANT INFORMATION

(Continued from Electron Linac form)

- (5) (cont.) An e⁺ bunch from the Positron Source is injected at the 200 MeV point of the injector. For C, the 2 e⁻ bunches and the single e⁺ bunch are then co-accelerated by a single rf pulse, separated by sign of charge into the 2 Damping Rings, then 2 damped e⁻ bunches and a single damped e⁺ bunch are reassembled in the linac and co-accelerated to high energy. (One e⁻ bunch is separated at the 2/3rd point (30 GeV) for positron production.)
- (6) Intensity: \sim 70% of Source (note 2.)
- (7) Pulse width, repetition rate: 120 ns (3 bunches) before 2/3rd point (note 5) and 60 ns (2 bunches) after with a repetition rate of 120 Hz for C; 5 ps (1 bunch) with a repetition rate up to 120 (60) Hz for I for $e^{-}(e^{+})$ respectively; and 200 ns to 2 μ s with a repetition rate of 120 Hz for FT.
- (8) Wave type: TW, constant gradient
- (9) v_g/c range: 0.0204 0.0065
- (10) RF power peak: 163 MW effective with SLED.
- (11) No. of bunches/pulse: 3 (including e⁺ bunch) in linac before 2/3rd point (note 5) and 2 after for C;
 1 (either e⁻ or e⁺) in linac for I; up to 7000 for FT at up to 30 GeV; up to 700 for FT at up to 50 GeV.
- (12) No. of particles/bunch: ~ 70% of Source (note 2) except e^+ in linac is about 0.9 of e^- in linac.
- (13) Final energy: 46.6 GeV is the normal energy of the linac for producing Z's at C. The maximum (noload) energy is 52 GeV. For FT experiments, the linac runs between 30 and 52 GeV. For I, the energies of the extracted beams will be in the range 2.5 - 12 GeV.
- (14) Beam intensity: about 4×10^{10} particles for each of the colliding bunches for C; similar intensity per bunch for I, and up to 4×10^{11} e^{-/} pulse for FT.
- (15) Norm. emit. (1 σ): For round beams for C or I, ~25 π mm-mrad each plane; for flat beams for C only, 40/6 for x(y) plane.

OTHER RELEVANT INFORMATION

* SCA - Superconducting Linear Accelerator

This is a superconducting linac using 55 cell cavities. We are beginning an upgrade to use TESLA 9 cell cavities, operating at 10 MeV/metre. The machine energy range will remain the same, but the output current will increase to 1 mA. The peak current (in a 2 ps micropulse) will increase to 40 A. The emittance will remain at 5 π mm-mrad.

(1) i) Duoplasmatron H⁻;
ii) Atomic Beam Polarized H⁻

This linac is a commercially available system manufactured by AccSys. Technology Inc, Pleasanton, CA. It is a 7 MeV H⁻ linac, a model PL-7. The RFQ (3 MeV H⁻) and DTL (4 MeV H⁻) are coupled directly together to form a single 4 m long accelerator which produces 7 MeV H⁻ for injection into a 2.24 Tm Synchrotron. The linac and synchrotron are now under construction, with first beam operation scheduled for mid-1998.

- * Dual-Axis Radiographic Hydrodynamic Test facility
- ** Two high-current electron beam accelerators to generate bremsstrahlung x-ray pulses for flash (-60 ns) radiography of very dense (areal mass - 100's g/sq.cm) objects moving very quickly (object velocities of many mm/microsecond)
- (1) Construction resumed after 15-month suspension
- (2) 106 MUSD (1st accel. all facilities) 187 MUSD (full, 2-machine facility)
- (3) cold-cathode field emitter or ArF eximer-laser driven photocathode
- (4) ~ 60-65 A/sq. cm
- (5) Normalized 4 × rms 700-1000 π mm-mrad (Lapostolle)
- (6) 60 ns flat-top, single square-wave pulse
- (7) Linear Induction Accelerator
- (8) Pulsed power charging time
- (9) (peak ~800MHz)
- (10) Water Blumlein PFLs
- (11) quadrufilar-wound, square-hollow Cu tube solenoids with iron homogonizer rings at injector anode, within 64 accelerating cells, and within HEBT. Peak field about 2.8 kG, 5.5 kG, iron-clad final focus solenoid for ~ 1.2 mm (2 rms) beam diameter on bremsstrahlung conversion target

DARHT will consist of two LIAs oriented perpendicular to each other to generate either two simultaneous radiographs containing 3D information or two time-sequenced radiographs.

The first machine (operational in 1999) will generate a single pulse. The second machine (operational in 2001) may generate 4 or more pulses at 2-5 MHz rep. rate.

OTHER RELEVANT INFORMATION

All eight sections used to accelerate electrons for CESR filling. For positrons, W target is inserted after section 4 (150 MeV). Positrons accelerated by sections 5 - 8 to 200 MeV. 7 - 21 μ bunch / pulse for either electron or positron operation.

- (1) 1966 electrons, 1976 positrons
- (2) 5×10^{10} (pos.), 3×10^{9} (elec.)
- (3) Two 214 MHz subharmonic Bunchers
- (4) 0.55 0.82 μs
- (5) Linac consists of 4 different types of sections all constant gradient (average 10 MeV/m). Section 1 - SLAC type Sections 2 - 8 and energy compressor - Varian

(6) RF pulse length 2.2 μ s on the flat-top

Focusing System

Type, No. of elements, and spacing : Solenoid coils for injector and section 1. Quad doublets or triplets between other sections.

- * Accelerator Test Facility
- (1) 0.0204 0.0065

The ATF has 3 beam lines and 15 User Experiments approved by a peer review committee.

High power (multi GW) laser beams, synchronized with the e^- beam are provided.

More information is on the World Wide Web from http://www.BNL.GOV. Select the Accelerator Test Facility link.

Original machine described in Part. Accel. 9 (1979), 1-156.

Converted to H^* acceleration in 1982.

Converted from Cockcroft-Walton to RFQ in 1989.

AGS Booster accepts approx. 4 pulses/3 sec; all remaining pulses go to Brookhaven Linac Isotope Producer (BLIP).

Beam Pulse width will be increased to 500µs during 1996 running period.

- (1) The linac began its life as the MkIII linac at Stanford University in the early 1960s. The accelerator sections are from some of the early production runs of the SLAC constant gradient structures. New rf, vacuum and magnet systems were added at Duke. Therefore, a construction cost is difficult to estimate. Installation of the linac at Duke began in 1993.
- (2) The electron source/injector is a single-cell rf thermionic gun with α-magnet for longitudinal matching. The cathode material is LaB₆. The gun operates at a nominal energy of 1 MeV.
- (3) 0.0204 0.0065
- (4) The linac sits in a 150m long tunnel, and will be extended to reach 1.2 GeV. An upgrade to 500 MeV is currently underway. A description of the linac can be found in a paper by P.G. O'Shea et al., to appear in the Proceedings of the 1995 IEEE Particle Accelerator Conference, Dallas, May 1995.

OTHER RELEVANT INFORMATION

In order to avoid ion trapping in the storage ring, SPring-8 Linac is able to provide positron beam. In the electron mode, the tungsten target is pulled out from the beam line.

The pulsed solenoid coil has adjustable mechanism for tilting and parallel movement to search the best position to have maximum positron yield.

- (3) With pulse width of 4 μs : 0.002 A With pulse width of 1 ns : 1 A
- (4) 2 S-band prebuncher and a buncher
- (5) Long pulse mode: pulse width : 500 400 ns spacing : 10 - 5000 ms
 - Short pulse mode: pulse width : 1 ns spacing : 500

(This mode is used for single bunch injection into storage ring)

- (6) 0.4 μ s for 2 m sections
- $0.6 0.7 \ \mu s$ for 3 m sections
- (7) Constant-gradient type. The diameter depends on the type of acc. tube.
- (8) Depends on the type of acc. tube. 0.28 Np (2m section), 0.44-0.51 Np (3m section)

Slow-positron beam is generated usually with beam energy of 60-75 MeV in the low-energy experimental room.

600 MeV storage ring NIJI-II for SR processing is usually filled with electron energy of 150 MeV.

800 MeV storage ring TERAS for SR research is usually filled with electron energy of 310 MeV.

500 MeV storage ring NIJI-IV dedicated to free-electron lasers is filled with electron energy of 310 - 340 MeV.

- * Prototype d'Installation pour Valider l'Accélérateur à Induction de Radiographie
- ** Accélérateur à Induction de Radiographie pour Imagerie X. (AIRIX is a new high resolution X-Ray Flash Radiography facility.)
- (1) The cost only includes the injector, 16 cells and 8 high voltage generators.
- (2) FWHM
- The injector is a single shot pulsed diode electron generator. The electron source is a ø 76mm Velvet cathode.
- This linac uses the induction technology. Magnetic cores are Ni-Zn ferrites. Cells are powered by 250kV high voltage generators.
- The normal operation is 6MeV final energy at present status with 8 induction cells. By the end of 1996 it will reach 8MeV with 16 induction cells.
- The emittance value is RMS normalized.
- The energy spread is measured over the flat-top duration of the electron pulse.

OTHER RELEVANT INFORMATION

- (1) 0.0075 0.022
- (2) Focusing triplets:
 - one after the buncher
 - one between the 2 accelerating sections
 - solenoids around each section

These data are values in standard operation. Initially, the gun and the buncher were designed to roduce high current (> 2.5 A) allowing the optional production of e+. As this option has been completely abandoned, the linac is running as a low current electron injector.

Gun's running mode

- Long pulse : 1.2 μs 25 mA
- Long pulse modulated by the 352 MHz of the ring. In this case, the gun emits current only during the positive part of the sinewave of 352 MHz.
- Short pulse : 2 ns pulse lengths from 1 to 4 pulses each 100 ms.

OTHER RELEVANT INFORMATION

(1) A second injector "NIL" provides short pulses which are bent at 16 MeV to the main Linac through an achromatic transport line. It allows "single bunch" injection into Super-ACO.

Electron Source

Type : Triode; Energy : 100 keV; Beam Intensity : 7 A

Injector

Long. matching : S-band Prebuncher and Buncher Output k.e.: 16 MeV; Intensity : 3.5 A Pulse width, spacing : 5 ns, 40 ms

- (2) Deflecting plates and S-band Buncher
- (3) 10000 to 11800
- (4) Klystron / F2040E
- (5) Solenoids upto 20 MeV, a triplet at 80 MeV, doublet at 200 MeV / 440 MeV / 680 MeV, a triplet before target

OTHER RELEVANT INFORMATION

The electrons are accelerated in five accelerator sections, which are powered by five klystrons. Each klystron is equipped with RF pulse compression.

The electron beam is focused by a quadrupole doublet onto the target.

Behind the converter, comprising the target and the small 1.8 T positron lens, there are two RF sections with 0.4 T solenoids, followed by a matching quadrupole doublet and 5 RF sections equipped with 25 quadrupoles in a FODO channel lattice. Six of these seven klystrons are equipped with RF pulse compression.

OTHER RELEVANT INFORMATION

- (1) Long. matching : 500 MHz Chopper and Prebuncher, S band Prebuncher and Buncher
- (2) The 100 MeV Trieste Linac can be operated in three different beam modes:

i) single bunch mode: one intense burst of electrons every 100ms (0.2nC in less that 1ns, 20 A peak); ii) multibunch mode: a variable time length pulse from 10 to 300 ns which is normally used for injecting into ELETTRA (10mA at 300 ns); the energy of the injection modes is kept at 100 MeV and the RF power requirements are 42MW 3 µs. iii) FEL mode: a train of 2 ns electron pulses at a frequency variable from 20.8 to 31.2 MHz in a macropulse of 10 µs length at 10 Hz repetition rate. In the FEL mode the energy range is variable from 30 to 75 MeV, with a RF pulse up to 10 µs, 22.5 MW.

OTHER RELEVANT INFORMATION

LIL - LEP Injector Linac

LINAC PERFORMANCE

** LEP - Large Electron Positron Collider

- (1) S-band pre-buncher and buncher
- (2) 0.0075 0.022

(3) 1-2% larger in the 2nd - 4th sections

(4) 2 equipped with RF pulse compression (LIPS)

Lepton production for the Electron-Positron Accumulator (EPA) at 500 MeV uses 2 linacs in series. For e^- , LIL runs at low charge. After passing through a 2mm hole in the e^+/e^- converter target (at 200 MeV) the e^- beam is accelerated another 300 MeV by 8 of the 12 sections.

For e^+ , LIL provides a high intensity 200 MeV e^- beam at the converter target with 4 sections. Then 12 sections accelerate the positrons, captured at 4 MeV, to 500 MeV.

OTHER ION BEAMS

Other info.

OTHER RELEVANT INFORMATION

- (1) determined by feedback; <10
- (2) 40, 600, 1000 max
- (3) (52+) 53+ (55+)

Constructed by international collaboration between CERN, France, Germany, Italy, India, Czech Republic, Sweden and Switzerland.

Parameters given for 208Pb, ions with q/m > 0.12 can also be accelerated provided source extraction for 2.5 keV/u is between 13 and 25 kV. Linac was designed for Pb25+.

Beams length modulated at source. Users are SPS ion physics, test beams and LEAR.

OTHER RELEVANT INFORMATION

- SRS Synchrotron Radiation Source *
- (1) Electron source uses an Eimac planar triode, 8755, fitted to the gun assembly. The anode is broken off, cathode/grid assembly is then reconditioned.

The source is modulated via the grid at 500 MHz.

Linear Collider Studies

Within the framework of an international collaboration, different approaches for Linear Colliders in the TeV range are under study. It is worth mentioning the main laboratories who contribute to this research, in the 1996 compendium of linacs.

An "International Linear Collider Technical Review Committee Report" was published by G. Loew (SLAC) in December 1995.

At EPAC96, J.P. Delahaye (CERN) presented a review on "Design Issues of TeV Linear Colliders".

The two following tables were presented at the Linac96 Conference by G. Loew. They show an updating of the parameters and they provide the reader with an overview of e^{-}/e^{+} linear colliders under consideration at 500 GeV.

For the sake of uniformity, the nominal luminosity is simply defined as N¹/4π ot ot it of a cast and no pinch. The actual luminosity incorporates all these effects, including crossing angle where applicable. NLC calculations assume crab-crossing.

¹¹ The main linac loaded gradient includes the effect of single-bunch (all modes) and multibunch beam loading, assuming that the bunches ride on crest. Beam loading is based on bunch charges in the linacs, which are slightly higher than at the IP.
