ABSTRACT

Measurement of time-dependent
 $B_d^0 - \bar{B}_d^0$ mixing at SLD

Ming Xiong Liu
Yale University
December 1997

The time dependence of $B_d^0 - \bar{B}_d^0$ mixing has been observed in events containing high- P_t leptons using a highly inclusive vertexing method to determine the B decay length and boost. The initial state B hadron flavour is determined using the large forward-backward asymmetry provided by the highly polarized electron beams of SLC in combination with a jet charge technique. From a sample of 150,000 hadronic Z^0 decays observed in the SLD detector at the SLC between 1993 and 1995, the mass difference between the two B_d^0 mass eigenstates has been measured to be $\Delta m_d = 0.486 \pm 0.065(\text{stat}) \pm 0.035(\text{syst}) \text{ ps}^{-1}$

Measurement of time-dependent
 $B_d^0 - \bar{B}_d^0$ mixing at SLD

Acknowledgements

I would like to thank many people for making this thesis possible. I am deeply indebted to my thesis advisor, Charlie Baltay, for his insightful guidance and for inspiring me with the love of physics. From him I have learnt not only the way to do good research, but also the importance of being able to see the wood of physics. This is the most important education I have received at Yale.

I personally thank Steve Manly, who actually played the roll of advisor, for his patient, reading through my thesis many times and makes it readable. He has been there for any kinds of discussions, with an always open office door. His insight of physics and insistence on excellence have always impressed me. He played a very important role in my graduate experience.

It has been a pleasure to work with the Yale SLD gang. I particularly thank Jeff Snyder from whom I learnt the first SLD code. Without him, my learning period could be much longer. His excellent work on the track 3D impact parameter has been extensively used in the analysis presented in this thesis. I also thank him for his careful reading of this thesis and suggesting on various matters from the physics contents to the grammar mistakes. I also thank Sumit Sen for his invaluable suggestions in writing code. His early work on the B boost helped me to develop the boost algorithm I used in this thesis. Thomas Moore, my fellow graduate student at Yale, brought me a lots of good questions to think about. His contribution to this thesis is innumeros.

In a large collaboration such as SLD, it is impossible to do any physics analyses without the collective efforts of many people. It has been a great pleasure to work with the B lifetime/mixing group in the past years. Among my fellows in the group, I am especially thankful to Stephane Willocq, Dong Su, Dave Jackson, Mike Ferro,

Tracy Usher and many others for fruitful discussions. I also would like to thank my fellow graduate student at MIT, Danning Dong, for making my countless trips to MIT full of joys during the hard time of new Vertex Detector (VXD3) construction. The VXD3 project would never be finished without our engineers Will Emmet and John Sinnott.

I would like to acknowledge other members of my thesis committee: Samuel MacDowell, Peter Parker and Michael Zeller for their careful reading of this thesis and their helpful comments.

I would like to thank Jean Belfonti for providing me with the opportunity to do teaching in the past years which gave me invaluable experience in the graduate school. Special thank goes to Brenda Naegel, Rochell Lauer and Carole DeVore for their kind assistance over the years.

In the last, I would like to extend my sincere appreciation to my wife. It is only because of her love and sacrifice that this thesis has become a reality. Thanks is not enough to my parents, for their continuous support throughout my education. I would like to dedicate this work to them.

This work was supported by the J. Sloane Fellowship, the N. Blatherwick Fellowship and the U.S. Department of Energy.

5.12	Topology of the Semileptonic B decay.	97
5.13	Distribution of 3D normalized impact parameters of tracks from IP (solid) and secondary vertices (dashed).	101
5.14	Error in the POCA determination due to track errors.	102
5.15	Number of good tracks used for the vertex reconstruction, for data (dot) and MC (solid line).	104
5.16	POCA-RMS distributions from data (dot) and MC (solid line).	105
5.17	Reconstructed decay length distributions for leptons from various sources.	106
5.18	Reconstructed B hadron decay length resolution.	107
5.19	Schematic diagram of B hadron semileptonic decay. The scaled jet energy E_{jet} of $b - jet1$ is calculated from (E, \vec{P}) conservation using event jet topology. The missing neutrino energy can be estimated from the imbalance of the scaled jet energy.	109
5.20	The B hadron fragmentation energy function. $z \equiv E_B/E_b$, with E_B and E_b are the B hadron and primary b quark energy, respectively.	110

5.21	Distributions of the scaled B-jet energy for 3-jet events and the missing energy in semileptonic B decays.	111
5.22	The vertex information is used to associate tracks to the secondary vertex.	112
5.23	The distance ratio of L/D from fragmentation (hatched) and secondary tracks.	113
5.24	Distributions of the reconstructed energy from charged and neutral particles associated to the B hadron, for data (dot) and Monte Carlo (solid line).	114
5.25	(a) Reconstructed boost from data and Monte Carlo. (b) The relative boost residual from MC.	115
5.26	Reconstructed proper time distributions for data and Monte Carlo events. Monte Carlo data also shows the contributions from various sources: non- $b\bar{b}$ events usually have small reconstructed proper time. .	116
5.27	Average reconstructed B hadron decay proper time residual from Monte Carlo events.	117
5.28	B hadron proper time residuals (unit: ps) from Monte Carlo at different true proper time bins: (a) $0.0 \leq \tau \leq 0.5ps$; (b) $0.5 \leq \tau \leq 1.0ps$; (c) $1.0 \leq \tau \leq 2.0ps$; (d) $2.0 \leq \tau \leq 4.0ps$; (e) $4.0 \leq \tau \leq 6.0ps$; (f) $6.0 \leq \tau \leq 10.0ps$. The absolute proper time error grows as the proper time increases.	118
5.29	B hadron proper time bias for leptons from cascade D decays.	119
6.1	Mixed fraction as a function of proper time for data (points) with the best fit curve assuming $\Delta m_s = 6.5 ps^{-1}$. The flat dotted line represents the case with no B_d^0 mixing.	125
6.2	Mixed fraction as a function of proper time for Monte Carlo events (points) with the best fit curve assuming $\Delta m_s = 6.5 ps^{-1}$. The flat dotted line represents the case with no B_d^0 mixing.	126
6.3	Reconstructed proper time distributions for $c\bar{c}$ and uds events.	142
6.4	Average b hadron lifetime from Data and MC.	145

6.5	B_d mixing measurements from the SLD. Values are quoted from last year (1996) publication. This thesis work updates the inclusive semileptonic B_d^0 mixing measurement. New final results from all four measurements will be released soon for this summer (1997).	149
