PRINT - A Text Formatting Program

James E. George
Stanford Linear Accelerator Center
Computation Group
Stanford, California

1. ABSTRACT

PRINT is a text formatting program written in PL/I to produce documents using the printer. The input to Print contains the text to be printed interspersed with the necessary control information to generate the desired format of the text. The features supported by PRINT are:

- Automatic or manual paging
- Page numbering with or without titling
- Paragraphing with or without indentation (left or right), numbering and/or titling
- Underlining
- Centering
- Tables with or without numbering
- Print direct image (i.e. print text as is)
- Right justification of the text
- Tabs

Also, the margin, line length and spacings between lines are variable. The aim was to provide a modular system which would be easy to change and would allow the value of any control variable to be changed by input control.

2. INTRODUCTION

The use of computer programs to format text to a final form for publication has been discussed in several documents (Meadow 1970; van Dam and Rice 1970; Berns 1968 and 1969). Basically, the problem is to take a linear string input and convert it to a multi-sheet two-dimensional document. Further, the final document is aesthetically good or bad by some undefinable human judgement. A really good program does not currently exist. PRINT represents a useable basic system for the preparation of a limited class of documents of interest to the author.

Initially, I became interested in text formatting
because I wanted to maintain a bibliography using a computer

text editing system; I was willing to maintain the entries

in alphabetic order, but wanted to be able to number the

text and vary the formatting on output (e.g. bibliography

vs. working form for constructing an annotated

bibliography). Although TEXT 360 (---1968) existed at the

time, it was not locally available; FORMAT (Berns 1968 and

1969) was available but did not have the numbering feature.

Hence, PRINT was originally developed to provide an

automatic numbering for successive entries for the

preparation of bibliographies; I also decided to develop it

as a personal document formatting system which I could

easily experiment with and modify for my own purposes.

Several documents have been produced using PRINT

(George 1969a and b; George and Hoffman 1969), the library

at SLAC has used it to produce a serials list (Section 5.2),

a two-dimensional expression capability has been illustrated

with PRINT (George 1971) and the cost of using it has been

studied (George and Hoffman 1969).

3. GENERAL DESCRIPTION

An output document from PRINT consists of chapters,

pages (with/without page title and/or page numbering),

paragraphs (with/without paragraph titles and/or paragraph

numbering), footnotes (with/without footnote numbering),

tables (with/without numbering), centered text, unaltered

text, underlined text, text whose position is controlled by

tabs and text which may be right justified**. In order to

form these output units, the input must be identified as

these units.

An input unit is denoted by a control character in

column 1; a blank in column 1 generally means a continuation

of the previous classification. Using these input units,

PRINT maintains two buffers from which it composes the

output document one line at a time. One buffer contains the

text input, excluding footnotes, which has not been used

(this buffer will be called the input buffer) and the other

-----------------------------------------------------------------

*The version of FORMAT locally available has been

extensively modified by John Ehrman (Ehrman-Berns 1971) and

was used to prepare Dave Griles's book (Griles 1971).

**A good discussion of justification is given in Meadow

(Meadow 1970, pgs. 253-256).
buffer contains the unused footnotes (this buffer will be called the footnote buffer).

PRINT's normal cycle is to select and print full lines from the input buffer; when the input buffer contains less than one full line, more input is requested from an input section. Footnotes interrupt the normal cycle whenever just enough room is left at the bottom of the current page to print the current contents of the footnote buffer. Full lines are selected by examining the buffer (input or footnote) starting at the current line length to be printed and scanning to the left for the first occurrence of a break character.

Footnotes are a problem in this and many other systems (e.g., see the discussion in Meadow 1970, pgs. 259-260). The problem is to at least start the footnote on the page where it is referenced. In PRINT, footnotes and references to footnotes are unrelated; a footnote is printed at the bottom of a page which usually has just enough room for the footnote. Generally, the footnotes occur on the same page as the reference, however it is possible for the footnote to appear before or after this page; this can be altered by the manual paging control or the drain buffer control.

The input function of PRINT separates the single input stream into footnotes, text and format control. The input continues processing until a non-footnote or non-format control is obtained.

The beginning of a footnote unit is indicated by the footnote control character occurring in column 1; all succeeding cards which have a blank in column 1 are part of the footnote and are saved in the footnote buffer. A footnote is terminated by the occurrence of a non-blank control character in column 1, other than the footnote control character.

The beginning of a format control change is indicated by the occurrence of the read new parameter control character in column 1. Upon recognition of this control character, the input function of PRINT executes a GET DATA statement in PL/1 thus allowing the value of any variable defined to be altered; usually these are the parameters controlling the formatting of the text.

In most cases, PRINT has two copies of each variable; one copy is used for format control and the value of the second copy is assigned to the first copy upon recognition
of a text unit. Hence, format control is specified before the text item appears and is assigned when the beginning of this text unit is recognized.

4. CONTROL AND VARIABLE DESCRIPTIONS

The text control tokens must occur in column 1 with the beginning of the text on the same card. These tokens are:

<table>
<thead>
<tr>
<th>NAMES</th>
<th>INITIAL VALUE</th>
<th>EXPLANATION</th>
</tr>
</thead>
<tbody>
<tr>
<td>PARC(PAR)</td>
<td>P</td>
<td>Indicates start of a new paragraph with numbering.</td>
</tr>
<tr>
<td>IDC(ID)</td>
<td>I</td>
<td>Indicates start of a new paragraph without numbering.</td>
</tr>
<tr>
<td>TABLE(TABLEG)</td>
<td>T</td>
<td>Indicates start of a table without numbering.</td>
</tr>
<tr>
<td>TABLEN(TABLN)</td>
<td>S</td>
<td>Indicates start of a table with numbering.</td>
</tr>
<tr>
<td>CENC(CEN)</td>
<td>C</td>
<td>Indicates that the text on this card is to be centered.</td>
</tr>
<tr>
<td>ASIS(ASI)</td>
<td>A</td>
<td>Indicates that the text on this card is to be printed as is.</td>
</tr>
</tbody>
</table>

All the text controls above may involve indentations except centering; the indentation is in terms of a multiplier of the basic indentation unit. For example,

12 Start of a paragraph

would start a new paragraph whose first line would be indented 2 times the basic unit to the right, and

1-2 Start of a paragraph

would start a new paragraph whose first line would be indented 2 times the basic unit to the left.

The table option functions like the paragraph for the

---------------------------------------------------------------------------

The name of the second copy of the variable is given followed by the name of the first copy in parentheses throughout this section; all control tokens are of type CHAR(1).
first line and then prints subsequent lines starting at the 
fifth tab position.

The footnote control character is (also type CHAR(1)):

<table>
<thead>
<tr>
<th>NAMES</th>
<th>INITIAL VALUE</th>
<th>EXPLANATION</th>
</tr>
</thead>
<tbody>
<tr>
<td>FTC(FT)</td>
<td>$</td>
<td>Indicates the beginning of a footnote.</td>
</tr>
</tbody>
</table>

Like the paragraph control, a single digit or a minus sign and a digit may immediately follow the footnote control to indicate the desired indentation.

The controls which may occur anywhere in any text are (also of type CHAR(1)):

<table>
<thead>
<tr>
<th>NAMES</th>
<th>INITIAL VALUE</th>
<th>EXPLANATION</th>
</tr>
</thead>
<tbody>
<tr>
<td>UNDERC(UNDER)</td>
<td></td>
<td>Indicates the beginning or end of the underlining; all text bracketed by underlines will be underlined. Should an error occur, the underline will be turned off by the next occurrence of a non-blank control character in column 1.</td>
</tr>
<tr>
<td>CTABC(CTAB)</td>
<td>@</td>
<td>Indicates a tab position.</td>
</tr>
</tbody>
</table>

The format control tokens must also occur in column 1 and any text contained on the card is lost. The controls are of type CHAR(1) and are:

<table>
<thead>
<tr>
<th>NAMES</th>
<th>INITIAL VALUE</th>
<th>EXPLANATION</th>
</tr>
</thead>
<tbody>
<tr>
<td>TERMC(TERM)</td>
<td>F</td>
<td>Terminate PRINT.</td>
</tr>
<tr>
<td>PAGC(PAGE)</td>
<td>X</td>
<td>Drain the input buffer and start a new page.</td>
</tr>
<tr>
<td>DR(DRA)</td>
<td>R</td>
<td>Drain the input buffer.</td>
</tr>
<tr>
<td>PARMC(PARM)</td>
<td>D</td>
<td>The following cards until an unquoted ';' contain variable names and values to read with PL/I's GET DATA statement.</td>
</tr>
</tbody>
</table>
CHAP(CHAPC) # Drain all buffers and initialize all variables.

The variables used during the printing are:

<table>
<thead>
<tr>
<th>NAMES</th>
<th>TYPE</th>
<th>INITIAL VALUE</th>
<th>EXPLANATION</th>
</tr>
</thead>
<tbody>
<tr>
<td>COLNUM(NUMCOL)</td>
<td>FIXED BIN</td>
<td>80</td>

</tr>
<tr>
<td>TABD(TAB(5))</td>
<td>FIXED BIN</td>
<td>25</td>
<td>&quot; &quot; &quot; for fifth tab position.</td>
</tr>
<tr>
<td>------(PGNUM)</td>
<td>FIXED BIN</td>
<td>1</td>
<td>Current page number; for new chapter '0' implies previous numbering.</td>
</tr>
<tr>
<td>------(PARNUM)</td>
<td>FIXED BIN</td>
<td>1</td>
<td>Current paragraph number; for new chapter '0' implies previous numbering.</td>
</tr>
<tr>
<td>------(FTNUM)</td>
<td>FIXED BIN</td>
<td>1</td>
<td>Current footnote number; for new chapter '0' implies previous numbering.</td>
</tr>
<tr>
<td>------(FTCOL)</td>
<td>FIXED BIN</td>
<td>50</td>
<td>Left margin for footnotes.</td>
</tr>
<tr>
<td>------(FTL)</td>
<td>FIXED BIN</td>
<td>50</td>
<td>Line length for footnotes.</td>
</tr>
<tr>
<td>SA(S1)</td>
<td>BIT(1)</td>
<td>TRUE</td>
<td>Number pages if true.</td>
</tr>
<tr>
<td>SB(S2)</td>
<td>BIT(1)</td>
<td>TRUE</td>
<td>Number paragraphs if true.</td>
</tr>
<tr>
<td>SC(S3)</td>
<td>BIT(1)</td>
<td>TRUE</td>
<td>Right justify if true.</td>
</tr>
<tr>
<td>SD(S4)</td>
<td>BIT(1)</td>
<td>TRUE</td>
<td>Number footnotes if true.</td>
</tr>
</tbody>
</table>
PGTITLE (PTITLE) CHAR(5) VAR NULL Paragraph title.
CHTITLE (CTITLE) CHAR(100) VAR NULL Chapter title.

The break characters which determine how the input is broken into lines are (all of type CHAR(1)):

<table>
<thead>
<tr>
<th>NAMES</th>
<th>INITIAL VALUE</th>
</tr>
</thead>
<tbody>
<tr>
<td>B1</td>
<td>(blank)</td>
</tr>
<tr>
<td>B2</td>
<td>. (period)</td>
</tr>
<tr>
<td>B3</td>
<td>, (comma)</td>
</tr>
<tr>
<td>B4</td>
<td>; (semicolon)</td>
</tr>
<tr>
<td>B5</td>
<td>: (colon)</td>
</tr>
<tr>
<td>B6</td>
<td>?</td>
</tr>
<tr>
<td>B7</td>
<td>! (exclamation point)</td>
</tr>
<tr>
<td>B8</td>
<td>- (dash)</td>
</tr>
<tr>
<td>B9</td>
<td>_ (underline)</td>
</tr>
</tbody>
</table>

Also, a character (variable MARKER) is printed in character position 1 of a line containing underlining or page faults; this allows the local version of a text editor (WYLBUR) to output the text to a typewriter.

A complete listing of PRINT is given in Appendix A.
5. EXAMPLES

Some examples were indicated in the Introduction. Some short examples will be given here.

5.1. Bibliography example

The input

produces the output

5.2. Serials example

POABSTRACT
I PRINT is a text formatting program written in PL/I to produce
documents using the printer. The input to Print contains the text to
be printed interspersed with the necessary control information to
generate the desired format of the text. The features supported by
PRINT are:
T2Automatic or manual paging
D
TSPACE=1 ;
T2Page numbering with or without titling
T2Paragraphing with or without indentation (left or right), numbering
and/or titling
T2Underlining
T2Centering
T2Tables with or without numbering
T2Print direct image (i.e. print text as is)
T2Right justification of the text
T2Tabs
D
TSPACE=2 ;
I00Also, the margin, line length and spacings between lines are variable.
The aim was to provide a modular system which would be easy to change and
would allow the value of any control variable to be changed by input
control.
POINTRODUCTION
I The use of computer programs to format text to a final form for
publication has been discussed in several documents (Meadow 1970;
van Dam and Rice 1970; Berns 1968 and 1969). Basically, the problem is
to take a linear string input and convert it to a multi-sheet two-dimensional
document. Further, the final document is aesthetically good or bad by some
undefined human judgement. A really good program does not currently
exist. PRINT represents a usable basic system for the preparation of
a limited class of documents of interest to the author.
I Initially, I became interested in text formatting because I wanted
to maintain a bibliography using a computer text editing system; I
was willing to maintain the entries in alphabetic order, but wanted
to be able to number the entries and vary the formatting on output
(e.g. bibliography vs. working form for constructing an annotated
bibliography). Although THIT 360 (----1968) existed at the time,
it was not locally available; FORMAT (Berns 1968 and 1969) was
available* but did not have the numbering feature. Hence, PRINT
was originally developed to provide an automatic numbering for successive entries for the preparation of bibliographies; I also decided to develop it as a personal document formatting system which I could easily experiment with and modify for my own purposes.

The version of PRINT locally available has been extensively modified by John Ehrman (Ehrman-Beran 1971) and was used to prepare Dave Gries's book (Gries 1971).

I Several documents have been produced using PRINT (George 1969a and b; George and Hoffman 1969), the library at SLAC has used it to produce a serials list (Section 5.2), a two-dimensional expression capability has been illustrated with PRINT (George 1971) and the cost of using it has been studied (George and Hoffman 1969).

**GENERAL DESCRIPTION**

I An output document from PRINT consists of chapters, pages (with/without page title and/or page numbering), paragraphs (with/without paragraph titles and/or paragraph numbering), footnotes (with/without footnote numbering), tables (with/without numbering), centered text, unaltered text, underlined text, text whose position is controlled by tabs and text which may be right justified. In order to form these output units, the input must be identified as these units.

A good discussion of justification is given in Meadow (Meadow 1970, pgs. 253-256).

I An input unit is denoted by a control character in column 1; a blank in column 1 generally means a continuation of the previous classification. Using these input units, PRINT maintains two buffers from which it composes the output document one line at a time. One buffer contains the text input, excluding footnotes, which has not been used (this buffer will be called the input buffer) and the other buffer contains the unused footnotes (this buffer will be called the footnote buffer).

I PRINT's normal cycle is to select and print full lines from the input buffer; when the input buffer contains less than one full line, more input is requested from an input section. Footnotes interrupt the normal cycle whenever just enough room is left at the bottom of the current page to print the current contents of the footnote buffer. Full lines are selected by examining the buffer (input or footnote) starting at the current line length to be printed and scanning to the left for the first occurrence of a break character.

I Footnotes are a problem in this and many other systems (e.g. see the discussion in Meadow 1970, pgs. 259-260). The problem is to at least start the footnote on the page where it is referenced. In PRINT, footnotes and references to footnotes are unrelated; a footnote is printed at the bottom of a page which usually has just enough room for the footnote. Generally, the footnotes occur on the same page as the reference, however it is possible for the footnote to appear before or after this page; this can be altered by the manual paging control or the drain buffer control.

I The input function of PRINT separates the single input stream into footnotes, text and format control. The input continues processing until a non-footnote or non-format control is obtained.

I The beginning of a footnote unit is indicated by the footnote control character occurring in column 1; all succeeding cards which have a blank in column 1 are part of the footnote and are saved in the footnote buffer. A footnote is terminated by the occurrence of a non-blank control character in column 1, other than the footnote control character.

I The beginning of a format control change is indicated by the occurrence of the read new parameter control character in column 1. Upon recognition of this control character, the input function of PRINT executes a GET DATA statement in PL/I thus allowing the value of any variable defined to be
altered: usually these are the parameters controlling the formatting of the text.

In most cases, PRINT has two copies of each variable; one copy is used for format control and the value of the second copy is assigned to the first copy upon recognition of a text unit. Hence, format control is specified before the text item appears and is assigned when the beginning of this text unit is recognized.

**POCONTROL AND VARIABLE DESCRIPTIONS**

I The text control tokens must occur in column 1 with the beginning of the text on the same card. These tokens are:

- **TO_NAME**_._INITIAL VALUE._._EXPLANATION
- TO_NAME is the name of the second copy of the variable given followed by the name of the first copy in parenthesis throughout this section; all control tokens are of type CHAR(1).

- **TOPARC** (PAR) DFFIndicates the start of a new paragraph with numbering.
- **TODIC** (ID) DIFIndicates the start of a new paragraph without numbering.
- **TOTAL TABLE** (TABLE) DIFIndicates the start of a table without numbering.
- **TOTAL TABLE** (TABLE) DIFIndicates the start of a table with numbering.
- **TOCEHC** (CEH) DIFIndicates that the text on this card is to be centered.
- **TOASIS** (ASI) DIFIndicates that the text on this card is to be printed as is.

I All the text controls above may involve indentations except centering; the indentation is in terms of a multiplier of the basic indentation unit. For example,

I 192Start of a paragraph
I would start a new paragraph whose first line would be indented 2 times
I the basic unit to the right, and
I
I 192-2Start of a paragraph
I would start a new paragraph whose first line would be indented 2 times
I the basic unit to the left.

I The table option functions like the paragraph for the first line and then prints subsequent lines starting at the fifth tab position.

I The footnote control character is (also type CHAR(1)):

- **TO_NAME**_._INITIAL VALUE._._EXPLANATION
- **TOFTC** (FT) DIFIndicates the beginning of a footnote.

I Like the paragraph control, a single digit or a minus sign and a digit may immediately follow the footnote control to indicate the desired indentation.

I The controls which may occur anywhere in any text are (also of type CHAR(1)):

- **TO_NAME**_._INITIAL VALUE._._EXPLANATION
- **TOUNDER** (UNDER) DIFIndicates the beginning or end of the underlining; all text bracketed by underlines will be underlined.

Should an error occur, the underline will be turned off by the next occurrence of a non-blank control character in column 1.

D

- **CTABC** = '/

- **TOCTABC** (CTAB) /AIndicates a tab position.

D

- **CTABC** = 'a';

I The format control tokens must also occur in column 1 and any text contained on the card is lost. The controls are of type CHAR(1) and are:

- **TO_NAME**_._INITIAL VALUE._._EXPLANATION
- **TOTERM** (TERM) DIFTerminate PRINT.
- **TOPAGC** (PAGE) DIFDrain the input buffer and start a new page.
- **TDR** (DR) DIFDrain the input buffer.
- **TOPARC** (PAR) DIFThe following cards until an unquoted ';'

contain variable names and values to read with PL/I's GET DATA statement.
TOC_HAP (CHARC) 000; Drain all buffers and initialize all variables.
I The variables used during the printing are:
D
TABA=18 TABD=35 TABC=45 TABE=45;
TO Names = _ INITIAL VALUE _ EXPLANATION_
TODCUMUN (BUCUM) FIXED BIN0000 Number of columns of the input card
to be used.
TODMAR (HARD) FIXED BIND108 Lines of margin at the bottom of a page.
TOLEN (L) FIXED BIN000 Length of line to be printed.
TOLMAR (COL) FIXED BIN0000 Width of left margin in characters.
TOSPACE (SPACET) FIXED BIND108 Inner paragraph, footnote and table spacing.
TOTSPACE (SPACE2) FIXED BIND208 Spacing at the beginning of a paragraph or
footnote.
TOTSPACE (SPACE3) FIXED BIND208 Spacing at the beginning of a table.
TODENT (DDL) FIXED BIN0000 Basic unit for indentation.
TOTMAR (HART) FIXED BIND108 Lines of margin at the top of a page.
TOTABA (TAB(1)) FIXED BINDS0 Character position from left margin for first
tab position.
TOTABA (TAB(2)) FIXED BIND108 = =
TOTABA (TAB(3)) FIXED BIND158 = =
TOTABA (TAB(4)) FIXED BIND208 = =
TOTABA (TAB(5)) FIXED BIND258 = =
TO-----(PGNUM) FIXED BIN000 Current page number; for new chapter
'0' implies previous numbering.
TO-----(PAGNUM) FIXED BIN000 Current paragraph number; for new chapter
'0' implies previous numbering.
TO-----(FPNUM) FIXED BIN000 Current footnote number; for new chapter
'0' implies previous numbering.
TO-----(FPCOL) FIXED BIN000 0 Left margin for footnotes.
TO-----(FP1) FIXED BIN000 Line length for footnotes.
TOSA (S1) ABXT (1) SUBE CHN Number pages if true.
TOSA (S2) ABXT (1) SUBE CHN Number paragraphs if true.
TOSA (S3) ABXT (1) SUBE CHN Right justify if true.
TOSA (S4) ABXT (1) SUBE CHN Number footnotes if true.
TOPTITLE (PTITLE) SCHAR (5) VARNULL Paragraph title.
TOPTITLE (CTITLE) SCHAR (100) VARNULL Chapter title.
I The break characters which determine how the input is
broken into lines are (all of type CHAR(1)):
T _Names = _ INITIAL VALUE_
T B10 (blank)
T B20. (period)
T B30. (comma)
T B40; (semicolon)
T B50 : (colon)
T B60 ?
T B70 ! (exclamation point)
T B80 - (dash)
T B90 _ (underline)
I Also, a character (variable MARKER) is printed in character position 1
of a line containing underlining or page faults; this allows the local
version of a text editor (WILDE) to output the text to a typewriter.
I A complete listing of PRINT is given in Appendix A.
